HIGHLIGHTS OF DIFFERENCES BETWEEN
THE PRESIDENT'S WETLANDS PLAN AND
S. 1304, THE BAUCUS-CHAFEE BILL

THE ADMINISTRATION PLAN	S. 1304, BAUCUS-CHAFEE BILL
PERMIT PROCESS	
<p>The Corps is directed to promulgate a public rulemaking establishing an administrative process for appeals of determinations of Corps jurisdiction, permit denials, and administrative penalties.</p> <p>Third parties may appeal only when a permit applicant appeals the denial of a permit.</p>	<p>Directs the Corps to establish by regulation an administrative process for appealing only permit determinations. No appeal of determinations of Corps jurisdiction or administrative penalties.</p> <p>Allows third parties to appeal permit approvals if the third parties have participated in the public comment process.</p>
MITIGATION BANKING	
<p>Regulatory guidance, issued by the Corps and EPA simultaneously with the release of the Plan, clarifies the use of mitigation banking for developing compensatory mitigation conditions in Section 404 permits. The guidance defines mitigation banking to include restoration, enhancement, preservation and creation.</p> <p>Recommends that Congress endorse the appropriate use of mitigation banking as a compensatory mitigation option and that the State Revolving Fund be used by states to capitalize mitigation banks.</p> <p>Contains no provision concerning payment of "fee charges" for participation in a mitigation bank.</p>	<p>Requires the Corps and EPA to jointly issue rules for the establishment, use, maintenance and oversight of mitigation banks. Limits mitigation banking to restoration only.</p> <p>Allows mitigation banks to be capitalized from the State Revolving Fund only if they are part of an approved state or local wetlands and watershed management plan.</p> <p>Requires the payment of "fee charges" for participation in a mitigation bank based on the "full costs of replacing lost wetlands functions and acreage."</p>

S. 1304, BAUCUS-CHAFEE BILL.	
THE ADMINISTRATION PLAN	AGRICULTURE
<p>Contains no provision adding haying and grazing to the exemption for normal farming or ranching activities.</p> <p>The SCS, the Corps, EPA and FWS are to enter into a Memorandum of Agreement within 120 days of the date of release of the Plan to develop procedures to provide that SCS wetland delineations will represent the "final" government position on Swampbuster and CWA jurisdiction on agricultural lands. The agencies are also to use the same procedures for delineating wetlands.</p> <p>Directs that a nationwide General Permit be issued for discharges associated with "minimal effects" and "frequently cropped with mitigation" conversions determined by SCS and FWS to qualify for exemption from Swampbuster provisions. Provides that an "individual review" by the Corps and EPA will "generally" not be required.</p>	<p>Adds haying and grazing to the exemption for normal farming and ranching activities.</p> <p>Provides that SCS, the Corps, EPA, and FWS must enter into agreements within 180 days of enactment to "develop consistent criteria and procedures for making technical determinations" under the Swampbuster program and the Section 404 program, including delineation of wetlands and prior converted croplands. Contains no specific directive making SCS the lead agency for delineations on agricultural lands.</p> <p>Allows a general permit to be issued for activities determined by SCS and FWS to be exempted under Swampbuster, but requires that an opportunity be provided for the Corps and EPA to "review determinations" by SCS.</p>
DELINEATION	DELINEATION
<p>Contains no specific provision calling for authorization of funds for small landowner assistance.</p>	<p>Authorizes the Corps and EPA to spend up to a combined \$5 million annually to assist "private landowners who lack the financial capacity" to delineate their lands or to assist such landowners in developing restoration or management plans for their lands.</p>

THE ADMINISTRATION PLAN	S. 1304, BAUCUS-CHAFEE BILL
<p>GENERAL PERMITS</p> <p>The Corps (only) is to issue guidance specifying when state, tribal, regional and local programs can effectively regulate Section 404 activities through issuance of Programmatic General Permits (PGPs). PGPs allow Federal general permits to be issued for an existing state, tribal, regional or local regulatory program whereby compliance with such a program becomes compliance with the Federal program. The Plan also calls for Congress to amend the CWA to explicitly provide for issuance of PGPs.</p> <p>Contains no "hammer" provision.</p>	<p>Programmatic General Permits may be issued subject to review by the Corps, EPA, FWS, and NOAA.</p> <p>Contains a "hammer" provision, under which PGPs may not remain in effect after 1996 unless (1) the state, tribal, regional or local government has developed and is implementing a wetland or watershed management plan, and (2) the responsible governmental unit has the legal authority and scientific capacity to discharge the program.</p>
<p>CLASSIFICATION</p> <p>EPA and the Corps issued guidance to their field staff in conjunction with the release of the Plan to clarify that small projects with minor environmental impact are subject to less rigorous permit review than larger projects with more substantial impact.</p> <p>Directs the agencies to expedite development of a new approach for wetland functional assessment known as Hydrogeomorphic Classification System. The system will assist agencies in assessing the relative severity of environmental impact of proposed discharges in order to determine the appropriate degree of flexibility in permitting referenced above.</p>	<p>No similar provision.</p> <p>No similar provision.</p>

THE ADMINISTRATION PLAN	S. 1304, BAUCUS-CHAFEE BILL
<p>ALASKA</p> <p>Citing "significant environmental consequences" that would attend the so-called "one percent rule," the Plan withdraws the proposed rule. The rule would have exempted wetlands in Alaska from mitigation requirements until one percent of Alaska's wetlands had been converted. The Plan states that there is enough flexibility in the existing Section 404 program to respond administratively to Alaska's unique concerns.</p> <p>The Plan directs EPA and the Corps to meet with the Federal resource agencies, Alaska and local government agencies, representatives of native villages, and industry and environmental groups in Alaska to consider "environmentally appropriate means to assure regulatory flexibility and the feasibility of alternative permitting procedures in Alaska."</p>	<p>No similar provision.</p> <p>No similar provision.</p>
<p>STATE ROLE</p> <p>Calls for Congress to authorize partial assumption of the Section 404 program by States and Tribes as an interim step toward full assumption.</p>	<p>No similar provision.</p>

September 9, 1993

**SIDE-BY-SIDE COMPARISON OF CURRENT WETLANDS LAW;
THE ADMINISTRATION'S PLAN; HR 1330 -- HAYES-RIDGE BILL; HR 350 -- EDWARDS BILL;
S. 1304 -- BAUCUS-CHAFEE BILL; ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL;
AND LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT**

CURRENT LAW	ADMINISTRATION PLAN	HR 1330: HAYES BILL	HR 360: EDWARDS BILL; AND S. 1186: BOXER BILL	S. 1304: BAUCUS-CHAFEE BILL	ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL	LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT AND COMMISSION REPORT (Gov. Bill Clinton of Arkansas, Chairman)
<p>Two different agencies rule on permit decisions. The Corps of Engineers (Coastal) can issue or deny permits. The Fish and Wildlife Service (FWS) can issue or deny permits. The Corps of Engineers can veto permit proceedings. The two agencies often have different interpretations of the Section 404 rules.</p> <p>U.S. Fish & Wildlife Service (FWS) and other Federal agencies may submit written comments on permit applications, but have no authority to deny permits.</p>	<p>Emphasize ultimate role of a single agency decisionmaker, while providing for coordinated efforts among the relevant agencies. The Corps will function in a leadership capacity as a "manager", with the other Federal resource agencies performing their advisory responsibilities. Supports continued use of 1982-404(g) MOAs concerning "delegation," designate the SCS as the lead agency for wetlands and establishes conditions of enforcement responsibility on agricultural lands.</p>	<p>Unifies the program in the Corps of Engineers which currently staffs and manages the program, as it has since inception of the program.</p> <p>Engages the FWS in a comprehensive site-by-site classification of wetlands according to their relative value. Other Federal agencies may comment on Section 404 permits but have no authority to deny permits.</p>	<p>DUAL REGULATORY REGIME</p> <p>Retains Corps/EPA dual permitting system.</p> <p>Adds another agency, the Department of Commerce, to the consultation process, along with the Department of Interior (through FWS). Consultation will be required by the Corps to either adopt the recommendations of both Commerce and Interior or supply written reasons for not adopting the agencies' recommendations.</p>	<p>Retains Corps/EPA dual permitting system.</p> <p>Requires EPA to make its review and a veto determination within six months of the Corps permit decision.</p> <p>Gives the Department of the Interior review authority over the Corps and EPA, for meeting the goals of the action 404 program in achieving program goals.</p>	<p>Retains Corps/EPA dual permitting system.</p>	<p>Recommends that Congress assign the responsibility for identification and maintenance of a wetlands program to one agency and require consultation with other affected agencies.</p>

CURRENT LAW	ADMINISTRATION PLAN	HR 1330: HAYES BILL	HR 360: EDWARDS BILL; AND S. 1185: BOXER BILL	S. 1304: BAUCUS-CHAFFE BILL	ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL	LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT--May, 1980 (Gov Bill Clinton of Arkansas, Chairman)
<p>Allows issuance of 5-year nationwide, regional, and statewide ("general") permits which regulate activities having minimal impacts on wetlands. Activities qualifying for general permits do not need individual permits</p> <p>Does not provide for administrative appeals of delineation decisions, permit denials, or administrative penalties</p>	<p>Requires the Corps to undertake, in close coordination with relevant State and Federal agencies, a field program to identify, inventory, and map wetlands. Section 28 for the purpose of regularizing and improving its use. Would amend 404(a) to recognize the concept of regionalized "category of waters" general permits.</p> <p>Requires that the Corps modify its procedures to allow for public rulemaking process to establish regulatory d-admins for reaching permit application decisions (generally within 90 days of issuance of public notice), unless precluded by other laws, such as NEPA.</p> <p>Requires the Corps to develop an administrative appeals process, implemented after public rulemaking, designed to allow for administrative appeals of the Corps' determination that it has jurisdiction over a particular property, permit denial and administrative penalties.</p>	<p>Expands use of general permits for all but highest value wetlands provided that the Corps determines separately or cumulatively, will not result in the loss of significant wetlands values and functions. Provides for expedited review of eligibility for general permits.</p> <p>Requires final Corps decisions on individual permits within 180 days. Estimates activities under local wetlands plans approved by the Corps.</p> <p>Provides an administrative process for appeals of delineation decisions and permit denials.</p>	<p>Restricts issuance of general permits by: requiring EPA approval duration of permits to 2 years; and imposing the sequencing methodology on general permits, which ensures lengthy procedures equivalent to individual permits.</p> <p>Provides severely limited "expedited permit review" for activities disturbing less than 1 acre performed by private individuals or businesses that employ less than 10 employees</p> <p>Expedited review is not available if either the Corps, EPA, DOA, or the permittee or its contractor that the permit receive further review.</p> <p>Does not contain an administrative process for appeals of delineation decisions and permit denials.</p>	<p>Revises the current five-year time period for general permits</p> <p>Subject to review by the Corps, EPA, FWS, and RDA, allows a federal general permit to be issued for an existing state, tribal, regional or local regulatory program under which compliance with such a program is a general permit under Section 404.</p> <p>Appears to add mitigation requirements to general permits.</p> <p>Requires permit applications to be decided upon by the Corps, EPA, DOA, and FWS. Not to include actions involving NEPA and the Endangered Species Act; where EPA, ODA, DDI, DOT, Commerce or the affected state request a delay; and where the Corps and the applicant determine additional time is required.</p> <p>Allows appeal of permit denials</p> <p>Also allows appeal of permit approvals by third parties who participated in the comment period</p>	<p>Retains the current five-year time period for general permits</p> <p>Allows issuance of a Federal "programmatically general permit" based on a state, regional, or local government regulatory program with certain safeguards. Such permits may be issued as long as the federal government is authorized and is implementing a wetland and watershed management plan.</p> <p>Directs the Corps to establish regulations under which permits for "minor activities" -- those of one acre or less -- are processed through direct, secondary, or cumulative impacts" -- are processed within 60 days of receipt of application.</p> <p>No administrative appeals process provided</p>	<p>Recommends that Congress direct the Corps to establish procedures to establish minimum sized wetlands for regulation</p>
PROCEDURAL REFORMS:						
(a) General Permits (b) Expedited Review (c) Appeals Process						

CURRENT LAW	ADMINISTRATION PLAN	HR 1330: HAYES BILL	HR 360: EDWARDS BILL; AND S. 1186: BOXER BILL	S. 1304: BAUCUS-CHAFEE BILL	ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL	LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT-May, 1980 (Gov. Bill Clinton of Arkansas, Chairman)
<p>All wetlands, despite widely varying values and functions, are subject to the same level of regulation. There are no distinctions between wetland functions and values. Relative functions and values are considered only when mitigation proposals are reviewed, much less in the process.</p>	<p>Provides that variations in wetlands functions can be applied in connection with watershed planning.</p> <p>EPA and Corps issued guidance to field staff clarifying and standardizing implementation of Guidelines to make regulatory decisions more objective and minimize environmental impact.</p> <p>Requires expediting development of new approach for wetlands functional assessment known as Hydrogeomorphic Classification System (HGS).</p> <p>Advance planning efforts will assess functions and values of local isolated wetlands and headwaters in connection with field level review of NWP 26 to develop regional descriptions of the wetlands and headwaters that are not subject to authorization under NWP 26.</p>	<p>Provides up-front classification of wetlands and requires that applicants have early notice of the type of wetlands involved. The most valuable class of wetlands is more strictly regulated than current law. Most wetlands will fall in the second category and will be regulated similarly to current law. Regulations will be more strict than existing test and incentives for mitigation.</p> <p>Only those lands that possess or <i>minimize</i> wetlands functions or values would be unregulated; the Corps has authority to monitor activities on even those wetlands through reporting requirements.</p>	<p>No classification. All wetlands are regulated to the same level of regulation. Makes no distinctions based on the relative environmental importance of the land.</p>	<p>Provides for "assessment of the functions and relative value of wetlands" only in the context of voluntary state wetlands and watershed management plans. Does not create this limited classification scheme with differing levels of regulation.</p>	<p>Contains no real classification scheme.</p> <p>Provides for "characterizing wetland resources" on a watershed basis in the context of state wetlands conservation programs. However, there is no correlation of the degree of regulation with the various functions and values of wetlands.</p>	<p>Notes that current definitions do not adequately differentiate the relative quality and value of wetlands. Calls for all levels of government and the private sector to support preservation of "high quality" wetlands.</p> <p>Recommends that Congress establish a wetlands protection program with incentives for landowners to "protect and establish high quality wetlands."</p> <p>Recommends that such a program emphasize conservation and reestablishment of bottomland hardwoods.</p>
<p>CLASSIFICATION OF WETLANDS</p>						

CURRENT LAW	ADMINISTRATION PLAN	HR 133D: HAYES BILL	HR 36D: EDWARDS BILL, AND S. 1186: BOXER BILL	S. 1304: BAUCUS-CHARFEE BILL	ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL	LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT--May, 1980 (Gov Bill Clinton of Arkansas, Chairman)
<p>Statutorily limited to the discharge of dredged or fill material. Recent agency attempts through rulemaking to expand the range of regulated activities to include drainage are of questionable legal validity under current law.</p>	<p>Issued final rule clarifying definitions of "discharge of dredged material" and "discharge of fill material." Requests that Congress take corresponding regulatory reform, including classification and regulation of activities related to their relative values and functions.</p> <p>The Corps will coordinate with EPA to develop additional general permits authorizing minor activities with only minimal adverse environmental effects.</p>	<p>Expands regulated activities by statute to include drainage, channelization and accretion of wetlands as part of overall regulatory reform, including classification and regulation of activities related to their relative values and functions.</p>	<p>Broadly expands regulated activities to include any "other alteration of navigable waters" which includes direct activities as well as possible indirect activities such as diversion of water. The Corps will coordinate with EPA to determine whether activities created by HR 36D is difficult to determine</p>	<p>Broadly expands the activities regulated under the federal program under the federal program. Expands federal jurisdiction to include "any addition" of dredged or fill material into navigable waters or would have the effect of destroying or degrading any area of navigable waters."</p> <p>Expands the definition of "fill material" to include "any material that has the effect of replacing, changing the bottom elevation or configuration of a water body."</p>	<p>Very similar to the Edwards bill provision. Broadly expands the activities regulated to include "other activities in navigable waters which impair the flow, reach, or circulation of surface water, or which result in a more than momentary change in the hydrology of such waters, or in the type distribution, or diversity of vegetation in such waters."</p>	<p>Recommend expansion of the activities regulated under the federal program to include drainage. Recommend a sampling prior converted croplands from regulation</p>
MITIGATION						
<p>A recent Corps/EPA Memorandum of Agreement imposes a strict "sequencing" methodology which stresses avoidance of activities in wetlands, regardless of relative environmental value or economic and other social considerations. The effect of sequencing is to encourage mitigation banking, since mitigation can be considered only after avoidance and minimization efforts are analyzed and found insufficient.</p> <p>The current "sequencing" test supports the Agency's position. Memorandum of Agreement did not allow public notice and comment.</p>	<p>Endorses sequential approach to mitigation and supports use of mitigation banking in appropriate circumstances. Provides for the issuance of a guidance letter clarifying the requirements for developing compensatory mitigation projects, as well as referring to the proposed guidance letter issued on mitigation banking.</p>	<p>Employs "sequencing" in high value areas, where environmental considerations are presumed to outweigh economic and other considerations. For other areas, replaces "sequencing" with the "public interest" balancing test, which includes economic and social considerations. Provides for mitigation banking, preservation, enhancement, or restoration, contributions to state mitigation bank programs, off-site mitigation, and construction of coastal erosion protection projects.</p> <p>Requires mitigation banking projects meet 25 year bonding requirements, and similar assurances of legal and financial responsibility.</p>	<p>Statutorily expands sequencing by requiring that no permit may be issued if there is a practicable alternative which would have less adverse environmental impact (i.e., precludes balancing of public interest factors).</p> <p>Calls for a report to Congress on the effects of compensatory mitigation taken pursuant to permits.</p>	<p>Revises current sequencing requirements.</p> <p>Calls for the Corps and EPA to issue joint rules for the establishment, use and oversight of mitigation banks.</p> <p>Lost wetlands are to be replaced to the extent practicable within the same project area. Mitigation banks for restoration projects only, not creation projects.</p> <p>Employs "consistent and scientifically sound methods" to determine mitigation bank "debit" and "credit" based on wetland values.</p> <p>Requires payment of "fee charges" for participation in mitigation banks based on the "full costs" of replacing lost wetland functions and acreage</p>	<p>Consolidates the current Corps/EPA sequencing methodology.</p> <p>Contains provisions for the establishment of mitigation banks that generally reflect those of the Baucus-Charfee bill.</p> <p>Allows mitigation banks to be used for creation, as well as restoration or enhancement. Establishes a minimum compensation ratio of 1:1 for restoration projects, requires "larger" compensation ratios for creation, enhancement and preservation.</p>	<p>Recommends that states establish wetland banking systems. Calls for Congress to direct appropriate federal agencies to develop procedures that clearly identify mitigation requirements</p>

CURRENT LAW	ADMINISTRATION PLAN	HR 1330: HAYES BILL	HR 360: EDWARDS BILL; AND S. 1196: BOXER BILL	S. 1304: BAUCUS-CHAFEE BILL	ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL	LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT - May, 1990 100v Bill Clinton of Arkansas, Chairman
<p>Gives states authority to assume the Section 404 program. But EPA seems to be reluctant to do so. Only one state has assumed the 404 program. A recent EPA study found that state assumption has failed largely due to lack of funding and inadequate flexibility in letting states design their own programs.</p>	<p>Promotes advance planning and wetland protection by State, Tribal, and local governments and private citizens. Provides incentives for States to develop watershed protection programs. Provides that State/Tribal wetlands conservation programs should endorse the Wetlands Delineation Cooperative Program. Provides that EPA, the authority to use the Wetlands Delineation program to fund development and State assumption of 404 program. Also recommends that Congress authorize partial assumption of 404 program by States and Tribes, in anticipation of full assumption. Would amend 404(b) to authorize issuance of Programmatic General Permits that defer to local regulatory programs implementing approved watershed plans</p>	<p>Gives states authority to assume the 404 program, establishes more flexible criteria to encourage state assumption and deference to local planning.</p>	<p>Repeals current law. Does nothing to simplify the process for state assumption of the 404 program.</p>	<p>Provides states with incentives to establish wetlands and watershed management plans. Plans are to include mapping wetlands and potential restoration sites, assessing the functions and relative values of wetlands, and developing and implementing measures to achieve increased protection and restoration of wetlands within the watershed. Allows general permits to be issued for an existing state, tribal, regional or local regulatory program approved by the Corps, EPA, FWS and NOAA. If the program provides the same degree of protection as the federal program and provides an opportunity for public review</p>	<p>Provides limited funding to assist states in assuming the 404 program or for issuance of state programmatic general permits. Provides limited funding to assist states in developing and implementing wetlands conservation plans. Such plans are to include mapping and "characterizing" wetlands on a watershed basis identifying sites with restoration or reconnection potential, and "water protection strategies for reducing causes of wetland degradation and restoring wetlands on a watershed basis."</p>	<p>Recommends expansion of state role through establishment of an area wide system of mitigation banking. Calls for Congress and coastal states to study and estimate approximately 20 freshwater and sediment diversions to replicate the natural action of the Mississippi River to restore vegetated marshlands and wetlands</p>

CURRENT LAW	ADMINISTRATION PLAN	HR 1330: HAYES BILL	HR 350: EDWARDS BILL; AND S. 1195: BOXER BILL	S. 1304: BAUCUS-CHARFEE BILL	ASSOCIATION OF STATE WETLANDS MANAGERS DRAFT BILL	LOWER MISSISSIPPI DELTA DEVELOPMENT COMMISSION REPORT-MAY, 1980 (Gov. Bill Clinton of Arkansas, Chairman)
<p>No statutory definition exists. The agency definition is ambiguous and in flux. The 1985 Federal manual for defining wetlands expanded the definition; the 1991 manual would have narrowed the definition. EPA and the Corps now use the 1991 manual.</p> <p>Section pending the outcome of the National Academy of Sciences (NAS) study currently underway. None of these changes, except the 1991 manual, were subject to public notice and comment.</p>	<p>Provides for continued use of 1987 federal manual until NAS study is completed, with any subsequent changes subject to a process that includes full opportunity for public comment.</p> <p>Defines "waters of the United States" to include the existing regulatory definitions implemented by the Corps and EPA, and the definition also should incorporate the existing regulatory definition of wetlands.</p> <p>Excludes "prior converted croplands" and "artificial wetlands" (such as non-tidal drainage and irrigation ditches excavated on uplands).</p>	<p>Requires Corps, in consultation with other Federal agencies, to establish standards for delineating wetlands. Such standards must require evidence of all three wetland parameters: hydrology, hydrophytic vegetation, and hydric soil.</p> <p>Provides for public notice and comment on any changes to the definition.</p>	<p>Prohibits clarification of the definition until the NAS study is complete. Requires any subsequent definition to consider the NAS findings. Makes no provision for public notice and comment procedures. Provides limited funding to assist land owners in delineating wetlands.</p>	<p>Expands the definition of wetlands beyond the definition contained in Corps and EPA regulations which includes swamps, marshes, and bogs, to include "fens, potholes, play lakes, vernal pools, and similar areas."</p> <p>Prevents further modifications of federal guidelines for delineating wetlands until the NAS study is complete. Provides for continued use of the 1987 federal manual until new guidelines are issued. Calls for new federal guidelines for delineating wetlands to be issued after the study is completed and the public notice and comment. The guidelines are to take into account regional variations in hydrology, soils and vegetation.</p>	<p>Requires use of the 1987 federal manual until the NAS study is complete. Directs the Corps, in cooperation with the EPA, to develop materials and conduct training courses for consultants, state and local governments, and landowners explaining the use of the 1987 federal manual. Allows the Corps and EPA, in cooperation with the states, to develop supplemental criteria and procedures for identification of regional wetlands types.</p>	<p>Calls for a definition of wetlands that takes into account the values of wetlands and considers relative wetlands values.</p>
<p>76% of the wetlands in the lower 48 states are privately owned, yet the current system does not consider possible rankings of the economic uses of their land by regulatory restriction.</p> <p>In the last two years, the U.S. Claims Court has found Section 404 permit denials to be "takings" requiring compensation in several cases.</p>	<p>No specific provision.</p> <p>Supports technical planning activities with property owners, and other programs that assist landowners in the implementation of such plans through restoration, technical assistance and information programs.</p>	<p>Provides that restrictions on the highest value wetlands, which can result in denial of all economic activity, can be deemed a taking: owners of land in this category may be required to sell the land to other forms at the fair market value and transfer title to the government, or retain title to the property and abide by the restrictions on land use.</p>	<p>No provision.</p>	<p>No provision.</p>	<p>No provision.</p>	<p>No provision.</p>
PROPERTY RIGHTS						

STATEMENT OF DEAN R. KLECKNER, PRESIDENT, AMERICAN FARM
BUREAU FEDERATION

Thank you Mr. Chairman. My name is Dean Kleckner, President of the American Farm Bureau Federation. We appreciate the opportunity to speak to you about the reauthorization of the Clean Water Act and proposed wetland provisions. From the perspective of farmers and ranchers, wetlands is one broad aspect of the Clean Water Act that needs your attention.

Farm Bureau supports the identification, protection and enhancement of quality wetlands if private property rights are protected and economic growth is enhanced. Rice growers are a prime example of what people will do for wetlands when incentives of owning private property and understanding the opportunity for economic growth exist. Three million acres of rice are planted each year in the United States. Rice farmers are making a specific effort to enhance wildlife habitat by winter flooding 1 million acres of rice fields. However, there are several obstacles that Congress must deal with in order to accomplish the goal of protecting and enhancing quality wetlands:

- First, there is the need for a clear definition of wetlands.
- Second, Congress, using sound science, must develop a comprehensive policy that clearly spells out which wetlands are important enough to be federally regulated.
- And third, adequate resources must be committed to make it work.

The Problem

From Farm Bureau's perspective, there are five major problems with the current wetlands regulations. First, the Clean Water Act was not designed to preserve wetlands—it was designed to prevent discharge of toxic materials into waters of the United States. Second, current wetland regulations fail to respect private property rights. Third, bureaucratic expansion of federal control over farmed land did not allow for public review and comment. Fourth, it is bad public policy if only professional government regulators can identify a wetland. And fifth, many farmers' attempts at good-faith compliance have been frustrated and proven prohibitively costly to resolve, thus placing the viability of the farming or ranching operation in jeopardy.

Private Property Rights

Central to the wetlands issue is the question of private property rights. More than 75 percent of wetlands are on private property. The 5th Amendment to our Constitution provides that private property may not be taken for public use without just compensation. Historically, the landowner has borne the burden of protecting this resource, both in the form of direct cost, and restricted use of property. We strongly believe there is a public obligation to shoulder these costs, since the public at large is the beneficiary.

Farm Bureau recommends that Congress reaffirm that wetlands are located on private property, and if a section 404 permit is denied or if unrealistic conditions are placed on obtaining a permit, the public owes the individual private landowner compensation for the protection of a public resource.

Detailed Comments and Recommendations on S. 1304

Section 3. Declaration of policies and goals, Section 101(a) (33 U.S.C. 1251(a)): Farm Bureau is very concerned about the vague nature, as stated, of a national policy to achieve, through regulatory and non-regulatory strategies, the restoration and no overall net loss of wetlands. We have the following questions about the proposed goal of both S. 1304 and the administration's new policy to achieve no net loss of remaining wetlands and increase the quantity and quality of wetlands in the United States.

- Does S. 1304 require a net gain in wetlands?
- How many acres of wetlands does S. 1304 require to be restored?
- Does S. 1304 reaffirm the policy of sequencing in which wetlands are avoided at all costs?
- What incentives does this committee recommend to encourage wetland restoration?
- Who will be responsible for a consistent wetland inventory in order to monitor restoration and efforts?
- Will the public compensate landowners for the protection of wetlands, or are individual landowners responsible for the cost of protecting the national wetland resource base?

- Should wetland regulations require a cost/benefit approach that balances private property rights, environmental quality, economic growth, and public health and safety with the benefits of the wetland protection/alteration?

Farm Bureau Recommends: The goal of this act should be directly related to water quality standards in the Clean Water Act and based on the scientific contribution wetlands have in managing water quality for human health and safety. S. 1304 should recognize and differentiate functions and values of existing wetlands and protect existing wetlands through a strategy of permits, compensation and mitigation.

Furthermore, the goal of increasing the quantity and quality of wetlands should be achieved through a voluntary non-regulatory strategy such as a wetlands reserve program. The goal should be to restore degraded wetlands, as well as previously drained wetlands, to the level necessary to achieve the water quality standards within a watershed without endangering other aspects of human health and safety. Tying the desire for an increase in quantity of wetlands to water quality standards puts a scientifically supportable and potentially definable cap on the amount of increase, rather than leaving the amount of increase totally open-ended.

We propose the following language:

“(8) it is the national policy to-

“(A) achieve, through a regulatory strategy of permits, compensation and mitigation, protection of existing wetlands and recognize that wetlands have different functions and values;

(B) achieve through voluntary non-regulatory strategies and the wetlands reserve program, the restoration of degraded and previously drained wetlands to increase the quantity and quality of the wetland resource base of the United States to the level necessary to achieve the water quality standards of the Clean Water Act; and

(C) provide for human health and safety while balancing the cost/benefits of regulations, economic growth and environmental quality.”

Section 4. Definition and Delineation of Wetlands

The temporary return to the 1987 wetland manual is an improvement over the 1989 manual, but it too contains some of the uncertainties that led to the original controversy. The conflict over wetland delineation stems from the lack of a clear public policy to apply good science. In that context we look forward to the product of the National Academy of Sciences, but we do not view the NAS study as a panacea. As members of the Senate, you, not the NAS, must be the arbiter of that conflict, the source of the compromise for what constitutes a federally regulated wetland. Eighteen more months of study will not resolve it.

The definition of navigable waters in S. 1304 is expanded to include potholes, playa lakes, vernal pools, and similar areas. This section also provides for changes in the delineation of wetlands only after the conclusion of the National Academy of Sciences study of wetlands.

Ultimately, private landowners should not be required to bear the cost of protecting “wetlands” that are recognized by the Clean Water Act and S. 1304 as being a “public benefit,” or in “the national interest.” Farm Bureau opposes the protection of “wetlands” that look convincingly like dryland or farm fields, nor should government policy protect areas as wetlands that only professional or government “scientists” can identify”. Congress should and must determine the overriding policy justifications, that certain types of wetlands may qualify scientifically as a wetland but should not be subject to Federal wetlands regulations.

Concern: Farm Bureau is very concerned that this definition and explicit expansion could mean that any of these geographic locations is a jurisdictional wetland, regardless of the absence of any required wetland criteria. It also fails to differentiate between a wetland by definition and a jurisdictional wetland.

Farm Bureau recommends:

- “Normal circumstances”—defined in this legislation to mean current physical conditions.
- Wetlands should be defined as naturally occurring areas of predominantly hydric soils, as determined by soil taxonomy, that support hydrophytic vegetation because of existing wetland hydrology. A hydric soil is a soil that in its natural state is saturated, flooded or ponded long enough during the active growing season to have predominant anaerobic conditions at the surface; and hydrophytic vegetation means a predominance of obligate wetland plants and facultative wetland plants.
- The avoidance of regional delineation manuals.

- Specific qualifications must be required for the individual making the delineation. Agencies administering delineation must recognize and be required to use the best available science in each of the individual scientific disciplines of soil science, plant science, and hydrology.
- Congress must require the National Academy of Sciences report to be scientifically field tested and the results subject to both congressional and public scrutiny before it is released or integrated into legislation.
- Congress should designate the Secretary of the Army acting through the Corps of Engineers as the sole authority for section 404 permits. In order to streamline the regulatory process, section 404 (c), the veto power of EPA should be removed. A streamlined process would give EPA, DOT and USDA general oversight, but not on a permit-by-permit basis.

Section 4.(b)(4); Delineation Training, Certification and Outreach.

The Administration has accurately characterized the situation by stating that "for too long, contradictory policies from feuding Federal agencies have blocked progress, creating uncertainty and confusion." Farm Bureau is concerned this situation will continue unless Congress requires development of a strong delineator certification program. The goal should be to have anyone who delineates wetlands certified and reviewed for consistency.

Farm Bureau supports S. 1304's efforts to have all federal agencies and private sector delineators trained and certified to improve accuracy and consistency in delineating jurisdictional wetlands. However, it fails to require an independent review board with explicit oversight and individual delineator performance evaluation.

Farm Bureau Recommends: The goal of this section should be to develop a national certification program that strives for consistency among all certified delineators.

Legislation should include a national certification program that requires:

- a) proficiency standards,
- b) 5-year certification duration,
- c) specific performance review and evaluation that would include:
 - 1) random field performance reviews;
 - 2) random data sheet performance reviews;
 - 3) emergency performance review based upon complaints; and
- d) continuing education.

Section 4.(b)(5); Assisting Small Landowners with Wetlands Delineation.

This section initiates the concept of federal assistance for small landowners and authorizes \$5 million to facilitate compliance with wetland regulations.

Concern: Farm Bureau is very concerned about the vague nature and limited resources committed to this proposal. We believe that individual assistance should be provided for the numerous legislative and regulatory mandates, but question this provision based on size, and limited resources.

Farm Bureau recommends Congress strengthen this section to include funding and federal assistance to anyone subject to the rules and regulations mandated by this legislation.

Section 6. Permit Processing Improvements-

This area is in need of reform to provide timely review and decisions on permit applications. We agree with S. 1304 in its attempt to provide decisions within a 90 day period.

Concerns: The timeliness of the review process may still drag on considerably. Also, Farm Bureau strongly believes Congress should include an appeals process for wetland delineations, permit denials and administration penalties.

Farm Bureau recommends that no more than one additional 90 day extension can be requested by any one agency or combination of agencies if additional data is required for an individual section 404 permit. If a decision is not made by the end of these time frames the permit should be considered granted. (See attached amendment)

Farm Bureau recommends the following regarding Costs and Fees of Parties: In court cases where a party other than the United States prevails, the prevailing party should be awarded fees and other expenses in connection with the proceeding regardless of whether the proceeding is brought by the United States for violations of the Act or by the prevailing party for issuance or denial of a section 404 permit. If the party is dissatisfied with the determination of fee and other expenses awarded, there should be an additional appeals process available.

Farm Bureau recommends Congress address an additional problem with the 404 program—an equitable, efficient and inexpensive means for landowners to appeal 1) delineations, 2) permit applications, and 3) penalties and fines without going to court.

Section 7. General Permit Improvements

Farm Bureau supports this section that generally continues the concept of general permits. We believe Congress should that allow state, regional or nationwide permits that will allow activities that cause only minimal adverse environmental effects.

Concern: Farm Bureau questions proposals that will make individual and general permits contingent on the development of watershed wetland management plans. We are also very concerned about what appears to be a new requirement to add mitigation requirements to general permits.

Farm Bureau recommends that this proposal should requiring the Corps to issue general permits for activities with minimal adverse environmental effects. We support general permits for activities impacting low value wetlands and oppose requirements contingent on mitigation.

Section 8. Coordination and Clarification of Program Concerning Agricultural Activities-

(b) Prior-Converted Cropland

The Environmental Protection Agency and Corps of Engineers have promulgated rules to exclude prior-converted cropland from the scope of Section 404. This was an important change but it did not go far enough to prevent confusion. Specifically, if the production of annual crops is required to maintain this exemption, problems will arise when farmers plant hay, orchards and other perennial crops on this land. This has a huge potential for providing conflict between the farm community and government regulators.

We are however, pleased to see the exemption for prior-converted cropland in S. 1304 and that the current administration has registered its support for this provision being placed into law but Congress must address the annual/perennial crop dilemma.

Farm Bureau recommends that Congress specifically exclude prior-converted cropland from section 404 regulation in this legislation.

Farmed wetlands

The Administration and S. 1304 recognize that prior-converted croplands are no longer wetlands. They should also recognize that some farmed wetlands no longer exhibit wetland characteristics and should not be regulated. Prior-Converted Croplands were once wetlands that were too wet to farm without drainage. Farmed Wetlands, on the other hand, are areas that are wet so infrequently that they can be farmed without drainage. Farm Bureau believes these areas should not be jurisdictional wetlands.

Farm Bureau recommends that Congress exclude tilled cropland and improved pasture from section 404 jurisdiction.

Section 8(d) Exempted Activities—Section 404(f)(1) (33 USC 1344(f))

Concern: Normal Farming Practices—Section 404(f) of the Clean Water Act intended for farms, ranches and forestry operations to continue “normal” farming and ranching activities including, but not limited to plowing, seeding, cultivating, minor drainage, harvesting, ditch maintenances, tile maintenances, brush clearing, etc., without having to obtain individual permits. Despite that intent, many of the conflicts between farmers and regulators are due to attempts by field office regulators with no familiarity with agriculture to define what constitutes a normal farming practice.

Farm Bureau recommends that Congress clarify that all farming activities are to be exempt from permit requirements. Because of the diversity of agriculture among commodities and regions of the country, Congress should restate and further clarify its intent to include all land used in production agriculture for food, fiber, timber and biomass.

Farm Bureau recommends that the word “normal” be dropped from the law in section 404(f)(1) because it has specific relation to the date the law was passed and thus inhibits the adoption of new or different farming practices at some future date.

Farm Bureau recommends the specific recognition that ranch roads should be allowed to be constructed and maintained the same as farm and forest roads.

Section 8. Soil Conservation Service

The USDA Soil Conservation Service should be the coordinating agency delineating wetlands on agricultural land.

We strongly agree with the administration's recommendation to make SCS wetlands delineations the final government position on the extent of Swampbuster and Clean Water Act jurisdiction on agricultural lands. However, we believe this concept needs to be incorporated in S. 1304 and enacted into law. It would provide much needed consistency and greatly reduce potential conflict.

Concern: We believe there are several reasons why SCS is the appropriate agency to delineate all wetlands on agricultural lands. SCS has offices in nearly every county, making it much more cost-effective and timely for them to do delineations than it would be for any of the other agencies. SCS is a technical assistance agency and is better able to recognize relict wetland situations where hydric soil is still present but hydrology has been removed. In addition, SCS is currently administering the Swampbuster program.

Farm Bureau strongly recommends that authority for delineation of all wetlands on agricultural land be the sole responsibility of the Soil Conservation Service (SCS).

Section 8. Exclusion of Man-Made Wetlands

Many wetlands are created, intentionally or unintentionally, as a result of human activities. Wetland vegetation that results from crop irrigation, saturation from broken drain tiles, flooding as a result of neglected stream maintenance, standing water from poorly designed public works projects, and the construction of farm and stock ponds are a few examples.

Farm Bureau recommends that artificially created wetlands should not fall under 404 jurisdiction because they are man-made and often unintentional. We support the amendments in S. 1304 regarding artificially created wetlands.

Farm Bureau recommends Congress recognize under certain circumstances, that some types of agricultural production are entirely compatible with conserving wetland functions and values. Forestry, cranberry and blueberry production, haying/grazing and some types of aquaculture are prime examples. Where such commodities can be produced in manner consistent with overall wetland functions, they should be encouraged and allowed to expand. Compatible activities such as cranberry production and aquaculture should be specifically mentioned along with stock watering, irrigation and rice production. Language exclusively limiting these artificial lakes and ponds to stock watering, irrigation and rice production should not limit the stocking of fish or seasonal efforts to provide waterfowl habitat.

Section 9. Mitigation Banking

Farm Bureau supports proposals to provide for mitigation banking.

Concern: Farm Bureau is concerned that this proposal provides no guidance on mitigation requirements (acreage), lacks specific guidelines in the replacement of functions and values and requires mitigation "in advance".

Farm Bureau recommends mitigation requirements based on the replacement of wetland functions, but in no case should acreage replacements exceed one acre for one acre. We also recommend changing the "mitigation bank" definition to remove the requirement for advance mitigation when simultaneous efforts will be practicable.

Section 9. Classification of Wetlands

Concern: Changes to section 404 should include a system of classifying wetlands, recognizing that not all wetlands share the same ecological value or perform the same functions. Those that are truly unique may be deserving of greater protection, whereas those that are marginal or only technically meet wetlands criteria should be subject to less stringent oversight.

Farm Bureau strongly recommends that the federal government adopt a standard method for inventorying wetlands which includes soil taxonomy as the basis for determining wetland soils, classifies wetlands on the basis of function and value, and requires that all government agencies adhere to this single inventory methodology. We suggest that the Corps of Engineers be mandated to conduct and maintain the inventory of wetland functions and values in consultation with the Soil Conservation Service. Regulatory efforts should only offer a protection to the nation's most valuable and unique wetland areas.

Section 11. Reports and Analysis-

Section 11 calls for collection of data and reporting to Congress and the public every two years regarding effects on navigable water of activities conducted under permit.

Concern: Currently all four federal agencies have wetland inventories that are conflicting and inconsistent. Farm Bureau strongly supports an accurate, consistent and current inventory of functions and values. We believe there should be a consistent definition for accounting and inventorying values and functions of wetlands in order for this reporting system to have policy implications.

Farm Bureau recommends that Congress consolidate all activities for wetland inventories into a national inventory maintained by the Secretary of the Army in consultation with the Soil Conservation Service.

Farm Bureau also recommends that the Fish and Wildlife Service's National Wetlands Inventory should end. In previous testimony to the House of Representatives we called for a national inventory of wetlands. However, a recent Duke University study¹ has caused us to believe that continuation of the National Wetlands Inventory in its present form would be redundant and no more useful than existing soil maps. The study found that National Wetland Inventory maps are accurate no more than 35 percent of the time. This is the same level of accuracy obtained by the Soil Survey maps already produced by the U.S. Soil Conservation Service. We do not need another inventory for wetlands if it is going to be no more accurate than maps we already have in most counties. Existing soil maps developed on the basis of soil taxonomy can be used to help make the first cut in wetland determinations, but no final determination should be allowed until an on-site delineation is performed.

As lands are taken out of production due to their classification as "wetlands", landowners have sought and obtained lower tax assessments based on the loss of value of wetland property. This erodes local tax bases, which are already strained to the limit.

Farm Bureau recommends that the EPA and the Corps of Engineers monitor the effects of the wetland regulation program on private property rights and on local tax bases, and report to Congress every two years on the subject.

Section 12. Wetlands Conservation, Management and Restoration

Section 12 requires the development of a watershed wetlands management plan. As written, it provides no mechanism for compensation for the loss of private property rights and/or restoration of wetlands or riparian areas. Also, it appears to add requirements for individual section 404 permits for all activity within a watershed unit (land-use planning). If so, this requirement extends section 404 permitting activity beyond jurisdictional wetlands.

Concern: Many farmers currently maintain as many as a dozen separate resource management plans. These management plans involve soil conservation, ground and surface water quality, animal waste, wetlands, and activities within coastal zones. These efforts, required by legislation, are very time consuming, confusing and redundant. We strongly believe proposals mandating management plans for clean water, wetlands, coastal zone, conservation, etc., should be consolidated. However, Farm Bureau is very concerned that such efforts will be interpreted by the administration and the courts as a congressional mandate for land-use planning and, therefore, result in the regulation of all activity within a watershed. Farm Bureau is strongly opposed to central or national land-use planning.

Farm Bureau Recommends Congress explore the proposal included in Vice President Gore's reinventing government report that calls for a consolidation of various environmental management plans into one farm plan. We believe one management plan, established from among affected private landowners within a specific watershed or management unit, will streamline and enhance agriculture's conservation and environmental quality efforts. We believe wetlands management should be part of the plan.

We recommend deletion of Section 12 of S. 1304 in its entirety and that wetland management concepts be integrated into one conservation effort.

Summary

We believe that the suggestions contained above will greatly improve the wetland regulatory program and reduce many of the inequities and difficulties faced by landowners and small businessmen. Farm Bureau supports the efforts of the National

¹ Street, William H. May, 1993. Field Reconnaissance of National Wetland Inventory Maps in the Carolina Slate Belt Region of Durham County, North Carolina. Duke University.

Wetlands Coalition, although the voting delegates of the American Farm Bureau chooses not to endorse the no-net-loss goal.

We would encourage and assist any constructive and cooperative efforts to resolve the question of financing the conservation of true and valuable wetlands. We look forward to working with you in this effort.

**TESTIMONY OF DOUGLAS B. INKLEY, DIRECTOR, BIODIVERSITY
CONSERVATION DIVISION, NATIONAL WILDLIFE FEDERATION**

Thank you for the opportunity to present to the Clean Water, Fisheries and Wildlife Subcommittee this statement on wetlands protection in the context of the reauthorization of the Clean Water Act. The National Wildlife Federation (NWF) is the nation's largest conservation education organization. Founded in 1936, the NWF works to educate and assist individuals and organizations to conserve natural resources, and to protect the Earth's environment. Our members and supporters are deeply concerned about the continued loss of wetlands and continue to work for the protection and expansion of our nation's valuable wetland resources.

Our testimony is outlined as follows: the first section explores the many functions and values of wetlands; the second section examines the status and trends of our nation's wetland resources; in section three, the NWF wetlands agenda is explained point by point; and section four addresses the NWF position on pending wetlands legislation. In addition, because of the importance of the issue, section five addresses Alaska's wetlands. And finally, section six summarizes and concludes the testimony.

Wetlands Functions and Values

It is well established in the scientific literature that wetlands provide a number of critical ecological functions from which the American public derives enormous benefits—economic and otherwise. Dozens of texts and hundreds of publications have analyzed wetlands functions and values, thus this testimony can only hope to provide a cursory overview of the topic. Because economics remains the axis on which many wetlands debates turn, it is vital that this Subcommittee understand fully the value of wetlands. Any reduction of federal protection for wetlands will have many economic, ecological and social ramifications.

Scientists generally agree that wetlands provide the following values and functions:¹

- Flood Conveyance
- Storm Surge Abatement
- Water Quality—Nonpoint Pollution and Sediment Control
- Groundwater Recharge and Discharge
- Habitats for Rare and Endangered Species, Waterfowl and Other Wildlife
- Habitats for Fish and Shellfish
- Recreation
- Water Supply
- Food Production
- Timber Production
- Historic and Archaeological Sites
- Education and Research
- Open Space and Aesthetics

Our testimony below addresses several of these functions.

Flood Conveyance

At times of peak runoff, rivers and streams often overflow their banks into adjacent floodplains. Wetlands, which are often referred to as natural sponges, soak up much of the water and slow its rate of flow. This ability to absorb floodwaters and release them over time gives these systems extraordinary value as sites for temporary water storage. In short, when wetlands are present to retain this overflow, peak flows of flood water are reduced, and floods are made less damaging.

Isolated wetlands and other non-riparian wetlands also hold rain and runoff water and contribute to flood control. Wetlands are especially valuable as flood moderators because the water they retain almost never reaches watercourses when they are at flood stage. For example, a study conducted in Wisconsin showed flood flows to be reduced by 80% in basins with wetlands as opposed to basins without

¹ From, "Protecting America's Wetlands: An Action Agenda. The Final Report of the National Wetlands Policy Forum. 1988. The Conservation Foundation. Washington, DC. 69 pp.

wetlands.² In addition, increasing acreage of hard-surface areas, such as highways, shopping centers, and housing developments within a watershed adds to the frequency of adjacent river and stream flooding.

Numerous case studies from around the country demonstrate the important flood conveyance function that wetlands can provide. In one instance, the U.S. Army Corps of Engineers [hereinafter "Corps"] elected to preserve wetlands through acquisition rather than construct extensive flood control facilities for a portion of the Charles River near Boston, Massachusetts. The Charles River Natural Valley Storage Project, as it came to be called, was completed in 1984 and—by protecting rather than destroying wetlands associated with the Charles River—has resulted in an annual savings of \$17 million in flood damage.

When the Mississippi overflowed its banks this summer, we learned how important wetlands can be for flood abatement. The latest damage estimates for the mid-west flooding range from \$10 billion to \$15 billion in total damages with 40,000 to 50,000 homes and businesses affected. Some estimates reported by the Federal Emergency Management Agency have suggested that as many as 80 percent of the affected buildings may have suffered "substantial damage," meaning they sustained damage in excess of 50 percent of the buildings' value. Many of these buildings were inundated for long periods of time, and many were still underwater, weeks after the floodwaters first arrived. For the buildings that have undergone such flooding, there exists a substantial public health threat if they are ever reoccupied.

This widespread flooding in Iowa and Missouri provides a graphic illustration of what happens when wetlands are drained on a massive scale—in this instance for agricultural production. According to the U.S. Fish and Wildlife Service [hereinafter "FWS"], Iowa has lost 89 percent of its wetlands since Colonial times. Missouri and Illinois have lost 87 percent and 85 percent respectively. In view of the well-established linkage between wetlands drainage and flooding, it is no wonder episodes such as that experienced in Iowa occur so regularly and severely.

In testimony presented to the Domestic Policy Council on Wetlands, the Minnesota Department of Natural Resources [DNR] attempted to quantify the economic benefits derived to the state in reduced flood damages by protecting wetlands.³ According to the State, it costs nearly \$300 for each acre-foot of flood storage that has to be created. In other words, if development eliminates a one acre wetland that holds 12 inches of water during a storm, the public costs to replace that water storage is \$300. With an estimated 5,000 acres of wetlands being lost annually in Minnesota, the cost of replacement storage to the State's residents is \$1.5 million—which exceeds the State's annual appropriation for flood control. As the DNR concludes, wetlands drainage—based on flood conveyance function alone—is simply bad economics.

Storm Surge Abatement

Coastal wetlands absorb and temper the impact of storm surges. Wetlands associated with barrier islands, salt marshes, and mangrove swamps act as giant storm buffers and can weather major storm events without sustaining lasting damage. The low gradient of many shorelines and the capacity of wetland vegetation to absorb and dissipate wave energy combine to counteract storm surges and prevent shoreline erosion. As a result, federal flood insurance is no longer offered to coastal communities to subsidize destruction of mangrove swamps, an indication that the public is beginning to recognize the value of these wetlands.

When Hurricane Andrew came ashore in Florida and Louisiana last year, the nation was reminded of the tremendous difference the presence of a coastal wetland buffer can make. The storm hit both states with approximately the same strength, yet Florida sustained over \$20 billion dollars in damage to Louisiana's \$2.5 billion. A large wetland buffer was present in Louisiana, no doubt sparing the state's population from similar damages. Nonetheless, Louisiana loses approximately 25 square miles of coastal land each year to geologic shifts and human development pressures.

Coastal development, which destroys or degrades the wetlands in barrier islands and other critical coastal wetlands, estuarine salt marshes, or lakeshore marshes, is likely to cause costly storm damage through the loss of critical buffer capacity. Thus, the assemblage of dunes, marshes, and woody vegetation that comprise our coastal wetlands, are much more important for their natural values than as expensive tracts of real estate on which to build resorts or summer homes.

² Status Report On Our Nation's Wetlands. 1988. National Wildlife Federation, Washington, D.C. Hereinafter, "NWF Trends Report."

³ Testimony presented to the Domestic Policy Council's Wetlands Task Force. Ron Nargang, Director, Division of Waters. Bismarck, North Dakota. August 17, 1990. Hereinafter "DNR Testimony."

Water Quality, Sediment Control and Nonpoint Pollution

One of the most important functions of wetlands is their ability to help maintain and improve the water quality of our Nation's rivers and other waterbodies. It is precisely for this reason that wetlands and their protection is fundamental to achievement of the CWA goal to "maintain and restore the chemical, physical, and biological integrity of the Nation's waters." Wetlands improve water quality and control nonpoint pollution in a number of ways including removing and retaining nutrients, processing chemical and organic wastes, and reducing sediment loads to receiving waters.

One example of a natural wetland which enhances water quality is the Alcovy River system in Georgia. Researchers there found that—after flowing through a three-mile stretch of wooded swamp—water polluted with chicken excrement and human waste was significantly improved in quality. The value of this wetland for water pollution control alone has been estimated to exceed \$1 million annually. In another case, researchers at the University of Michigan learned that a 1,700-acre peat bog could treat 100,000 gallons of secondarily treated wastewater per day. The wetland removed roughly 70 percent of ammonia nitrogen, 99 percent of nitrite and nitrate nitrogen percent and 95% of total dissolved phosphorus from the wastewater, much of it in less than 24 hours.

According to the Minnesota DNR, combined federal-state expenditures in the State on nonpoint pollution control alone over the past decade approaches \$20 million dollars. Based on its experience, once again the State of Minnesota concluded that it is economic folly to continue eliminating its natural filters—wetlands—from the landscape while at the same time having to increase public expenditures to control non-point source pollution.⁴

Groundwater Recharge and Discharge

In some instances, wetlands play an important role in replenishing or "recharging" groundwater supplies. Surface water bodies connected to groundwater systems can recharge these systems as their waters migrate and percolate into the surrounding Aquifer. Wetland recharge sites serve an important role in maintaining groundwater levels at the local or regional level. In Massachusetts, a 2,700-acre wetland recharges a 16-square mile shallow aquifer at a rate of eight million gallons per day. The aquifer provides much of the water supply for the town of Amherst.

Prairie potholes, glaciated wetlands of the Northeast and Midwest, and southern cypress swamps are among the types of wetlands that serve as valuable recharge areas. These wetlands occur where there is an elevated water table, and they often contribute to adjoining shallow aquifers. Seasonal wetlands in the prairie pothole region are important to the maintenance of high water tables. High water tables, in turn, provide water for livestock during droughts and can be vitally important to the long-term water balance of the prairies by providing significant recharge to soil moisture.⁵ Not only does enhanced soil moisture recharged by prairie wetlands improve crop production, but emergent wetland plants found in these areas can provide abundant forage for livestock.

With supplies of clean water becoming increasingly precious throughout the Nation, we cannot afford to overlook the important role wetlands play in the cycle of water. Although research is needed to understand more fully the dynamics of water movement into, through, and out of wetlands, we do know that wetlands and groundwater are inextricably linked. Strong wetlands protection programs, therefore, are essential to protecting and providing an abundant and healthy water supply for all Americans.

Habitats for Rare and Endangered Species, Waterfowl, and Other Wildlife

Wetlands are critical habitats for a variety of plants and animals. Research has demonstrated that wetlands of less than one acre in size support an abundance of life forms. The loss of wetlands—both large and small—therefore impacts a broad array of plants and animals. One of the more obvious groups of animals to be affected by the destruction of wetlands is waterfowl.

Ducks, geese and swans are some of the more prominent wildlife species to make use of wetlands, and—as discussed below—are important economically. The well-being of waterfowl populations is tied directly to the status and abundance of wetland habitats. Simply said, as the wetlands go, so go our waterfowl. That waterfowl

⁴ DNR Testimony.

⁵ Hubbard, D.E. 1988. Glaciated prairie wetland functions and values: a synthesis of the literature. U.S. Fish and Wildlife Service. Washington, DC. 50 pages.

populations have reached record low levels in recent years should come as no surprise to anyone who understands that the Nation's wetlands inventory is at its lowest level in recorded history.

Besides waterfowl, a large number of federally listed threatened and endangered species rely on wetlands for their survival. As of June 1993, 408 animals and 384 plants were listed as threatened or endangered in the United States. According to a recent NWF report, of the 592 species listed in 1992, forty-three percent [256] of these animals and plants depend directly or indirectly on wetlands to complete their life cycle successfully. In addition, of the more than 2,500 plants in need of federal protection, as many as 700 are wetland-dependent or related.⁶

Aside from the threatened and endangered species that depend on wetlands for their survival, 5,000 species of plants, 190 species of amphibians, and 270 species of birds are estimated to occur in the Nation's wetlands. As if to confirm what many ecologists have long suspected, in 1991 The Nature Conservancy [TNC] reported that North America's aquatic fauna are in serious trouble.⁷ According to TNC, one out of three North American fishes and two out of three of the continent's crayfishes are rare or imperiled. Mussels appear even more threatened: one in every ten North American freshwater mussel species has become extinct in this century and 73 percent of the remaining species are now rare or imperiled. The primary reason for the decline of these "aquatic canaries"—not surprisingly—appears to be habitat loss and degradation.

For years man has relied on fish and wildlife resources as an "early warning system" and an indicator of environmental quality. For anyone willing to listen, the bells and sirens have sounded for our Nation's wetlands—these systems and the myriad plant and animal communities that depend on them are in serious trouble. Greater wetlands protection—not less—is the only remedy.

Fish and Shellfish

Wetlands are—literally—the cradle of the nation's seafood industry. Fish and shellfish depend on estuaries for spawning and nursery grounds, food production, and migration. A bumper sticker frequently seen in coastal North Carolina succinctly states the importance of wetlands to the fishing industry - "No Wetlands, No Seafood." It doesn't get any simpler, or truer, than that.

The National Wildlife Federation and others have long emphasized to Congress the importance of preserving wetlands to protect the nation's seafood industry. According to a recent report, the annual economic value of estuarine habitats is approximately \$14 billion. In the late 1980's commercial landings of estuarine-dependent species contributed some \$5 billion to \$6 billion to the economy. Despite these figures, over half of the nation's fishery-supporting wetlands have been lost, a fact that the National Marine Fisheries Service (NMFS) claims cost the fisheries \$208 million each year in the mid-1980's.

Recent data compiled and published by the NMFS dramatically underscore the wetlands-fisheries nexus.⁸ For example:

- 75% of U.S. commercial fish and shellfish landings consist of species dependent on coastal wetlands and estuaries.
- All fish species harvested commercially or recreationally off Atlantic, Pacific, and Gulf of Mexico Coasts have been reduced to historic low levels of abundance.
- There has been a 42% decline in commercial landings of fish and shellfish along the southeast Atlantic and Gulf of Mexico Coasts since 1982.
- The Maryland oyster harvest has declined 90% since 1890.
- Migratory fish in the Chesapeake Bay have declined, on average, 82% between the 1960's and the 1980's.
- 33% of the Nation's remaining shellfish waters are closed on any given day because of pollution.

Depending on the region of the country, the percentage of wetland-dependent fish species varies. For example, 98% of all marine species in the Gulf of Mexico spend part of their lives in wetlands and marshes. In the southeastern U.S. This percentage is slightly lower—94%. The trends are clear. Historic commercial fish and shellfish harvests are in steep decline and the primary factor for these declines appears to be the loss and degradation of wetlands.

⁶ NWF Trends Report.

⁷ Aquatic Animals: Endangerment Alert The Nature Conservancy Magazine. March/April 1991.

⁸ Chambers Report.

Florida has been dramatically affected. According to published accounts, shrimp harvests in that state have decreased by more than 75% since the early 1980's, and the fishery off the southwest tip of Florida is on the verge of total collapse. Scientists believe the collapse can be traced to a number of significant changes in the wetland-tidal ecosystem, including—restricted flows of freshwater from the Everglades, runaway development that has converted thousands of acres of mangrove swamps and other critical wetlands, loss of seagrass beds from onshore development, and high levels of pesticides and other contaminants in agricultural runoff.

Clearly, concern for a strong and proactive §404 program now extends well beyond the environmental community which—for the past 20 years—has worked to improve and expand on the program. And, while the environmental community will continue to press for improvements to §404, Congress can no longer ignore the burgeoning constituencies, such as commercial fishermen and shell fishermen whose passions, and—in many instances whose livelihoods—hinge entirely on a strong federal wetlands protection program:

Recreation

Recreational opportunities is another important contribution that wetlands make to the citizens of our nation. To illustrate the extent of waterfowl hunting, the U.S. Fish and Wildlife Service (FWS) estimates that in 1985 some 2.7 million waterfowl hunters spent almost 24 million hunter-days afield spending approximately \$600 million.⁹ In 1985, 6.3 million hunters (38 percent) spent almost 87 million days hunting on wetlands acreage. Clearly, millions of dollars have been spent in states represented by Members of this Subcommittee alone for recreational hunting on wetlands.

Recreational fishing is also an important wetland-dependent activity that generates millions of dollars annually. Nation-wide, according to FWS estimates, some 35.6 million anglers took 454 million trips for 511 million total days, spending almost \$24 billion in the process. As illustrated in Table 1, in the 10 states represented by this Subcommittee, over 9 million anglers spent more than 120 million days afield fishing in 1991. This, in turn, generated a total annual expenditure of \$5.2 billion dollars—an average of more than \$500 million per year per state.

Finally, the amount of money spent by Americans on other wildlife-related activities associated with wetlands involves billions of dollars each year. For example, the FWS estimates that 55 million people spent almost \$10 billion in 1980 observing and photographing waterfowl and other wetland-dependent species of birds. This is an annual expenditure of almost \$200 per person. Clearly, wetlands are important to the Nation for hunting and fishing, as aesthetic retreats and places of diversity for nature study, and are central to the enjoyment of millions of Americans.

Economic Benefits of Wetlands

Throughout the preceding, our testimony touched on a variety of ways in which wetlands provide major economic benefits. The message is simple: wetlands conservation is good economics. When a single three mile stretch of river in Alcovy, Georgia improves water quality at an estimated value of \$3 million annually, when wetlands refill the aquifers that supply drinking water to thousands of communities like Amherst, Massachusetts, and when wetland buffers save states like Louisiana billions of dollars in potential Hurricane damage, the benefits of wetlands protection become self-evident.

In Maryland, the Department of Economic and Employment Development estimates the value of the Chesapeake Bay at \$678 billion. Despite the degraded condition of the Bay—due partially to the loss of wetlands—over 100 million pounds of seafood are annually harvested by commercial fishermen, oystermen, and crabbers. As we have seen, seventy-five percent of commercial and recreational fish catches depend on wetlands for part of their life cycles, and commercial landings of estuarine-dependent species contribute \$6 billion annually to the U.S. economy.

Americans across the country spend billions of dollars each year on wildlife-related recreation activities. According to the FWS, almost 109 million people took part in wildlife-related activities in 1991, spending some \$59 billion in the process. In 1985, 55 million people spent almost \$10 billion dollars photographing waterfowl and other wetland dependent-species of birds alone. Be it for hunting, fishing or photographing wildlife, the value of wetlands as a recreational resource cannot be ignored.

⁹ 1985 National Survey of Fishing, Hunting, and Wildlife Associated Recreation. U.S. Fish and Wildlife Service. (hereinafter cited as FWS Survey 1985) p. 59

Wetlands have other economic benefits as well. By providing unique opportunities for research and education, containing historic and archaeological sites, providing habitat for rare and endangered species, and providing open space and aesthetic improvements to communities, wetlands improve surrounding property values and yield countless other benefits. Medical discoveries from plants, fish and wildlife have already been worth billions of dollars to industry, the full value of which also must be measured in terms of human life and health.

Because it is difficult to quantify their values, wetlands often fare poorly when competing against other uses. Government subsidy programs in the form of tax incentives and agricultural price supports often confer a competitive advantage oriented toward agriculture and development. As a result, destruction of wetlands continues at an alarming rate.

Wetlands Provide Jobs

It is important that the Members of this Subcommittee realize that wetlands provide jobs—jobs that in many cases are irreplaceable. The \$55 billion commercial and recreational fishing industry employs over 1 million workers across the country. In the 10 states represented by the Members of this Subcommittee, over 235,000 people work in recreational fishing-related jobs. Those same 10 states also support 36,000 commercial fishermen and 14,000 plant processing jobs.

The commercial and recreational fishing industry in Florida, for example, employs 110,444 people. The dockside value of the 1991 commercial catch was \$162 million; annual sport fishing expenditures in the state topped \$2 billion. In Minnesota, recreational fishermen spent \$816 million dollars in 1991, supporting 27,000 people in fishing-related industries. Without the wetlands, the fish and the jobs that depend on them will disappear.

Status and Trends of our Nation's Wetlands

Wetlands destruction is changing the face of America. Water that once remained in low spots and provided habitat for wildlife, now collects in ditches and tile lines and is rushed to the nearest stream. Millions of acres that once grew cat tails, wildrice, and pondweeds now support wheat, corn; houses, factories, airports and roads . . . many millions of acres of good waterfowl habitat have been destroyed and the loss continues.¹⁰

This straightforward observation on wetlands destruction, taken from the 1964 U.S. government publication *Waterfowl Tomorrow*, is more timely today than when it was first written almost 30 years ago. As discussed below, the loss of wetlands in America continues at an unacceptably high rate—almost 300,000 acres per year.

Considering the tremendous functions and values these systems provide, the fact that America has lost 50 percent of its wetlands, and the sobering realization that wetlands now occupy only 5 percent of the Country's surface area, should be cause for alarm. For too long this nation has embraced a myopic wetlands philosophy that can only be described as "squander now, pay later."

Unless this Congress awakens to the fact that the status quo is no longer acceptable, and unless its Members are bold and courageous enough to take aggressive and positive steps to strengthen and improve on § 404, then we have assured a future for the nation which holds fewer and fewer wetlands.

Despite disingenuous arguments from groups such as the American Farm Bureau that the nation's wetlands resources are actually increasing, it is abundantly clear that the nation continues to lose these critical resources at a staggering rate. A 1990 FWS study found that, in the lower 48 states, more than half of the nation's original wetland acreage is now gone.¹¹ This translates to a loss in excess of 60 acres per hour—one acre per minute—in the 200 years since the 1780's. Some states' wetlands losses have been extreme. For example, California and Ohio have lost more than 90 percent of their original wetlands, and Iowa, Indiana and Illinois have lost 89 percent, 87 percent, and 85 percent, respectively. Ten states have lost 70 percent or more of their original wetland acreage. The serious erosion of our national wetlands inventory is underscored by the fact that 22 states have now lost more than 50% of their original wetlands.

Wetlands losses in states of Members of this Subcommittee are no exception to this rule. As graphically illustrated on the following pages, four states [Connecticut, Idaho, Pennsylvania and Nevada] have lost in excess of 50 percent of their original

¹⁰ *Waterfowl Tomorrow*. 1964. Bureau of Sport Fisheries and Wildlife. Washington, DC. 770 pages.

¹¹ Dahl, T.E. 1990. *Wetland losses in the United States 1780's to 1980's*. U.S. Dept of the Interior, Fish and Wildlife Service, Washington, DC. 13 pp. Hereinafter, "1990 FWS Report."

wetlands and all but one state [Maine] has lost at least 25 percent of their original wetlands. With these losses go the tremendous wetlands functions and values discussed above. Whether it is. The valuable fish and shellfish nursery grounds in Connecticut, Florida, Maine, New Jersey, Rhode Island, or Virginia, critical flood control in Iowa or Minnesota, or important fish and wildlife recreational opportunities in Idaho, Vermont, or Wyoming, the unabated loss of wetlands in these states is taking its toll on their economies, their residents, and their residents' quality of life. As the 1990 FWS report starkly concludes,

... These data on the Nation's wetlands loss provide a clear indication that continued loss will jeopardize a valuable resource. Over a 200-year timespan, wet land acreage has diminished to the point where environmental and even socio-economic benefits [i.e., groundwater supply and water quality, shoreline erosion, floodwater storage and trapping of sediments, and climatic changes] are now seriously threatened."¹²

In addition to the 1990 FWS Report, the FWS released another major wetlands study in 1991 entitled *Status and Trends of Wetlands in the Conterminous United States*. This report confirms that the Nation's wetland hemorrhage continues, with the primary cause of wetlands destruction still conversion to agricultural land uses. Some of the findings of the report include the following:

- During the nine year study period, the nation had a net loss of 2.6 million wetland acres. This translates to an average annual net loss of approximately 290,000 acres, which is about two-thirds of the loss rates measured from the 1950's to the 1970's.
- More than 3 million acres of freshwater wetlands were lost during the study period. These losses represent the vast majority [98%] of wetland losses documented between the 1970's and 1980's.
- Estuarine wetlands declined by 70,000 acres, primarily in the Gulf Coast States, due largely to the shifting of emergent wetlands to open salt water.
- Although wetlands losses attributable to agricultural conversions declined from the previous study period, these losses still represent the majority [54%] of wetland losses in the U.S. Importantly, conversions to "other" land uses accounted for more than 40% of the total losses documented. Depending on how this category—which describes wetlands cleared and drained but not yet put to an identifiable use—is treated, the percentage of wetlands lost to agricultural conversion could be much greater than reported.¹³

Fortunately, a wake up call has sounded and the Nation is beginning to comprehend the enormity and gravity of the wetlands crisis. As a result, Congress has begun taking positive—albeit limited—steps to begin stemming the tide of wetlands loss. The 101st Congress enacted several wetlands laws that included new wetlands protection provisions of the Food, Agriculture, Conservation and Trade Act of 1990, provided for funding of wetlands conservation projects pursuant to the North American Wetlands Conservation Act ["NAWCA"], and established the Coastal Wetlands Restoration and Protection Act to begin combating runaway coastal wetlands losses in Louisiana and in other states. These newly-enacted laws provide the Nation with considerable new spending authorities for wetlands protection and—if fully funded—will bring important new resources to bear on the wetlands crisis.

While these efforts are both meritorious and ambitious, they alone cannot get the job done. Fiscal limitations and simple disregard for the functions and values of wetlands preclude a nonregulatory program—one reliant on acquisition, easements, tax breaks and other fiscal subsidies—from ever stemming the tide of wetlands losses. Thus, programs such as the NAWCA are doomed unless the Nation has a strong, complementary regulatory program that redirects development out of wetlands and restricts the conversion and destruction of yet more wetlands to development. Federal non-regulatory programs to purchase and restore wetlands must be complemented by real restrictions which protect the functions and values of wetlands that accrue to the public at large. We simply cannot "maintain and restore the chemical, physical, and biological integrity of the Nation's waters" without a combination of strong regulatory programs and ambitious acquisition and restoration efforts.

Therefore, an effective and vigorous § 404 program is essential for protecting wetlands and other waters of the United States. To achieve a strengthened and im-

¹² 1990 FWS Report.

¹³ For example, there is reason to speculate that runoff of the "other" wetland areas were cleared and drained for agricultural purposes but, because of economic or other factors, have not yet been planted to crops.

proved § 404 program, we must maintain the key components of the existing program, make minor adjustments to the current program to ensure it operates smoothly, and—most importantly—strengthen the program to surmount its serious deficiencies that continue to allow the destruction of wetlands and other aquatic systems.

The National Wildlife Federation Wetlands Agenda

Because of the critical ecological function wetlands play in the hydrological cycle, their protection is critical for meeting the Clean Water Act goal “to protect and maintain the chemical, physical, and biological integrity of our nation’s waters.” It is for precisely this reason that the Subcommittee should adopt policies to strengthen and expand protection of the nation’s wetlands resources.

In the past, implementation of the § 404 program has been plagued with institutional and administrative problems which have frustrated the regulated community and the environmental community, while allowing our wetlands base to continue to erode. Although these problems must be remedied, wholesale changes to the program is not the answer. Instead we must work within the existing framework and fine tune the process.

Most of the criticism of § 404 does not involve major programmatic deficiencies but instead focuses on delayed delineations and ambiguous-permitting expectations. Some landowners reportedly have experienced long delays in receiving delineations from the Corps District offices. Other applicants claim to have received inaccurate delineations that were conducted by poorly-trained consultants. And, partly as a result of misinformation generated and circulated by the regulated community and other opponents of § 404, still others remain confused by the program’s content and scope.

A number of environmental groups, including NWF, have shared many of the same frustrations in obtaining timely answers and dependable information from Corps and EPA personnel. Therefore, we urge this Subcommittee to explore our recommendations to provide timely resolution to these problems. Many of the recommendations are included in S. 1195, the “Wetlands Reform Act,” introduced by Senator Barbara Boxer. The NWF strongly supports S. 1195, and urges its inclusion in the Clean Water Act reauthorization.

Our specific recommendations are as follows:

- Expand CWA § 404 to cover drainage, dredging, flooding, clearing, channelizing, placement of piling-supported structures, and other significant physical wetlands alterations, regardless of whether any of these activities entail a discharge of dredge or fill material. The NWF, and more recently the National Wetlands Policy Forum, recognized that the nation cannot seriously address the problem of wetlands loss without the ability to control all major forms of physical wetlands alteration—not just discharges of dredged or fill material as provided under the existing § 404 program. The current rate of wetlands loss is a stark reminder that many activities that destroy wetlands often go completely unregulated by § 404 and other state and federal programs, and continue unabated. We strongly recommend that the Subcommittee amend § 404 to cover these other forms of alterations. Expanding the scope of regulated activities would offer greater protection to wetlands, and it would actually help decrease much of the uncertainty associated with the program. Partly due to lack of clear direction, the Corps has historically made overly narrow and often inconsistent interpretations of what constitutes a discharge of dredged or fill material requiring a § 404 permit. As a result, activities such as ditching, stream channelization, and clearing and bulldozing of wetlands vegetation have been inconsistently regulated, and a lot of time and resources have been expended by the regulatory agencies, the regulated public, and environmentalists debating this problem. Expansion of § 404 to explicitly cover all major physical alterations of wetlands is necessary to fully protect wetlands and to eliminate this source of uncertainty and needless resource drain.
- The Corps should continue to administer the § 404 program with EPA oversight. In the past, the Corps’ weak implementation and enforcement of the § 404 has been a liability to achieving the goals of the CWA and the overall effectiveness of protecting wetlands under § 404. Recently, however, the Corps and EPA have begun working together to better solve longstanding problems with the § 404 program. These initiatives include the establishment of the Wetlands Mitigation Memorandum of Agreement and the proposed rule to close the loophole for “de minimis” discharges. Both of these initiatives demonstrate to us that

the program can run smoothly while maintaining dual agency oversight. But if the status quo is to be changed by vesting the § 404 program in one agency, administration of the program should go to EPA, not the Corps because EPA is the author of the § 404 (b) (1) guidelines and EPA is charged with administration of the Clean Water Act.

- Explicitly include wetlands in the Clean Water Act goal statement. Although an explicit wetlands protection goal does not currently exist in the Clean Water Act, wetlands are an essential component of the waters of the United States, of § 404, and of other CWA provisions. We, therefore, recommend amending the CWA goal section to include explicit reference to wetlands to ensure that all relevant provisions of the CWA contribute to wetlands protection.
- Strengthen the general permit program. The Corps' general permit program, particularly, Nationwide Permit 26, sanctions the unreviewed and unmitigated loss of thousands of wet land acres annually. Furthermore, inadequate public involvement in overseeing this program seriously weakens its implementation and does nothing but expedite wetlands losses. Therefore, we recommend amending § 404 to (1) require general permits to include adequate measures to track activities conducted pursuant to general permits; (2) forbid authorizing activities under general permits for which states have denied § 401 water quality certification; and (3) provide the public and state and federal resource agencies with predischARGE notifications and an opportunity to comment before activities are undertaken pursuant to general permits. Section 404(e) should be amended to require that each Corps district prepare reports documenting each activity and the amount of acreage affected that is authorized by each general permit and to require that the Corps submit a biennial report to Congress of cumulative impacts to wetlands and other aquatic areas under each general permit.
- Strengthen the role of Fish and Wildlife Service and the National Marine Fisheries Service in § 404 permit decisions. Currently, the Clean Water Act and the Fish and Wildlife Coordination Act require the Corps to consult with the FWS and National Marine Fisheries Service (NMFS) on all § 404 permits. Although these resource agencies can recommend that modifications be made to the permits, the Corps can, and frequently does, ignore these comments. Therefore, we recommend amending § 404 to require the Corps to provide written explanation of its reasons for rejecting FWS or NMFS comments and to explain how the Corps' permit determination is consistent with the purposes of the Clean Water Act and the § 404(b)(1) guidelines.
- Earmark § 404 enforcement penalties for § 404 implementation. Historically, the Corps' and EPA's § 404 implementation programs have been severely underfunded. To make available additional resources over and above appropriated monies from general revenues, we recommend amending § 404 to establish an account into which § 404 enforcement penalties would be deposited for use by the EPA and Corps for § 404 program implementation.
- Modify § 404 state water quality certification requirements to better protect aquatic ecosystems. While § 401 certification requirements are generally required from states before a § 404 permit is issued by the Corps, questions have arisen over whether the requirement applies to Federal Energy Regulatory Commission licensing and whether states can or must—include narrative standards to protect wetlands and other aquatic habitats from degradation. Therefore, we recommend amending § 404 to expressly broaden the protections provided by § 401 and direct states to address physical and biological alterations of aquatic areas, as well as chemical pollution of those waters.
- Legislate EPA's definition of "fill material." For years the Corps and EPA have been at odds over the regulatory definition of "fill material." The result has been massive confusion and both agencies shirking the regulation of discharges of a number of materials that destroy wetlands [e.g., waste tires and mine tailings]. For this reason, we recommend amending § 404 to legislate EPA's definition of fill as any material which has the effect of replacing an aquatic area with dry land or of changing the bottom elevation of a waterbody.
- Strengthen the CWA citizen suit provision (§ 505) to provide for stronger wetlands protection by private citizens. Given the paucity of agency enforcement resources, vigilant private enforcement of § 404 is critical to protecting the nation's wetlands. One reform which should be made is to clearly provide that § 505 applies to § 404 violations. Section 505 should also be amended to encourage courts to overcome their reluctance to impose restoration requirements in cases in which restoration of degraded wetlands is both practical and desirable.
- Make the § 404 program more efficient by adopting a fast track provision for minor permits. Special priority should be given to minor permit applications

(*e.g.*, permits for activities that would disturb no more than 1 acre of wetlands) to ensure that they are processed within 60 days. Section 404(q) should be amended to require the Corps to allocate sufficient personnel to expedite minor permit applications in this fashion.

We urge the Subcommittee—and Congress—to step back from the controversies and reaffirm the critical role that the § 404 program plays in attaining the central goal of the Clean Water Act—to restore and maintain the integrity of the Nation's waters. We also urge the Subcommittee to assist our efforts in securing and applying more resources to § 404 wetlands delineations, mapping, outreach and education, and to the program in general, and thereby make its value and importance more understandable to everyone. Finally, we urge Congress to support the nation's burgeoning interest in protecting wetlands by expanding the reach of regulated activities under § 404 and by incorporating the additional strengthening amendments highlighted above. These are progressive and necessary changes if we are ever to achieve the goals of the CWA and end the long history of wetlands loss in this nation.

Pending Legislation

The NWF commends Senators Boxer, Baucus, and Chafee for their efforts, through the introduction of legislation, to resolve the extremely controversial and difficult issue of wetlands protection. We look forward to working closely with you, the Subcommittee, and the full Environment and Public Works Committee to craft legislation as part of the Clean Water Act reauthorization that will finally bring a halt to the continued destruction of this nation's wetlands.

S. 1195 and H.R. 350, "The Wetlands Reform Act"

NWF strongly supports S. 1195, the "Wetlands Reform Act," introduced by Senator Barbara Boxer on July 1, 1993. This bill, identical in content to H.R. 350 introduced by Representative Don Edwards (D-CA), presents a balanced solution to the wetlands issue. Importantly, S. 1195 would finally close the existing loopholes in section 404 of the Clean Water Act, by specifically regulating most activities that impact wetlands, not just the deposition of dredge and fill material. S. 1195 is a balanced bill in that it also addresses the concerns of the regulated community. It finally puts in place through legislation existing exemptions for the agricultural community. Furthermore, the agricultural and developmental communities' concerns regarding permitting delays are specifically addressed by a new expedited permitting procedure, requiring the processing of small-scale permits within 60 days. Complementing the regulatory program, S. 1195 provides tax incentives to encourage voluntary wetlands conservation, as well.

S. 1304, "Wetlands Conservation and Regulatory Improvements Act"

NWF appreciates the efforts of Senators Max Baucus (D-MT) and John Chafee (R-RI) in their attempt to craft a bill intended to bring all parties to the table and finally resolve this issue. Broader in scope than S. 1195, their bill addresses a number of additional issues, many of which are controversial.

There are many components of S. 1304 which the NWF supports. Importantly, S. 1304 finally confirms that the scope of regulated activities includes many activities, such as ditching, draining, and channelization, which the Army Corps of Engineers has failed to regulate. S. 1304 would provide a landowner assistance program to help small landowners with delineation of wetlands on their property. It requires the Corps to monitor its general permit program. Currently, the Corps is unable to adequately track this program to determine the real impact that general permits have on wetland habitats. S. 1304 initiates an appeals process for permitting decisions. This would allow landowners to appeal permitting decisions without having to resort to the judicial system as the only means of appealing decisions. Importantly and unlike the Clinton administration's recent proposal, S. 1304 provides a balanced process by also allowing any party involved in the permit process to appeal permit issuances as well as permit denials. Finally, we support the bill's adoption of the Environmental Protection Agency's definition of fill material. It is critical that these provisions be retained in the final version of the bill.

NWF strongly recommends strengthening amendments regarding other aspects of S. 1304. In the absence of these amendments, the NWF cannot support the bill. In particular, we are concerned about the practicality of the watershed planning process, and the use of this process to encourage local and regional general permits. While we support the concept of watershed management planning if implemented in a manner that compliments and strengthens the federal wetlands program, we are concerned that the past failure of this concept, coupled with the delegation of

the wetlands protection program to state and local entities, would fragment federal conservation authority and enforcement, resulting in less wetlands protection and accelerated wetlands loss. We oppose delegation to local authorities and all federal financial incentives for state and local assumption. NWF is also concerned that even large projects, and those with a high potential impact on the wetlands resource, would be able to obtain an expedited permit (60 days) if the project is within an area with an approved watershed management plan. These projects should instead be subject to a complete scientific analysis, public review, and comment process. We also oppose language codifying the prior-converted wetlands exemptions. These wetlands, comprising 54 million acres, still serve important wetland functions and should not be exempted from protection under the Clean Water Act.

Senators Baucus and Chafee have long been important leaders in wetlands conservation and their bill, S. 1304, is an important starting point towards improving wetlands conservation. We look forward to working with you to strengthen this bill to maintain and restore America's wetlands.

H.R. 1330, "The Comprehensive Wetlands Conservation and Management Act of 1993"

NWF strongly opposes H.R. 1330 and believes it would be more appropriately titled "The Comprehensive Wetlands Destruction Act of 1993." H.R. 1330, introduced by Representative Jimmy Hayes (DLA), is designed to weaken and in some cases eliminate federal protection of wetlands in this country. The bill completely rewrites section 404 (§ 404) of the Clean Water Act (CWA), and disregards the 20 years of experience the agencies have acquired during its implementation. If H.R. 1330 is enacted, § 404 would be rebuilt from scratch to develop a completely new regulatory program, creating years of confusion for wetlands regulators and the regulated community.

Almost too numerous to list, the faults of H.R. 1330 are many and we completely oppose it. H.R. 1330 would eliminate the role of the EPA in § 404 permit review, despite their importance in overseeing the program and expertise in environmental protection. It would establish a policy of "wetland triage" by ranking wetlands into high, medium and low value categories with the later two categories receiving little or no protection. This completely fails to recognize the natural diversity of functions which wetlands provide, by essentially setting up an arbitrary system of comparing apples and oranges and then determining that one is more important than the other. H.R. 1330 would also narrow the current scientific definition of wetlands, replace it with an arbitrary and politically-motivated standard, thereby removing half of the nation's wetlands acres from any protection under the Clean Water Act's wetlands protection program. The bill imposes new and significant financial liabilities which would bankrupt the federal treasury by requiring federal acquisition, at the discretion of the landowner, of so-called "high value" wetlands. A conservative estimate by the GAO suggests a \$10-\$15 billion cost for the land acquisition components alone, of H.R. 1330. Furthermore, this is completely unnecessary in light of the constitutional protection already provided. In short, H.R. 1330 converts the existing § 404 regulatory program to little more than a costly "rubber stamping" program for issuing wetlands destruction permits. This bill is a disaster for wetlands, and would be a disaster for America.

The Clinton Administration Wetlands policy—"protecting America's Wetlands, A Fair and Flexible Approach"

The Clinton Administration's attempt to devise a sound and manageable wetlands protection policy falls short of the mark. While it does improve some aspects of federal wetlands policy, overall the proposal represents a "net-loss" for wetlands, and must be strengthened to truly protect and rebuild the nation's wetlands resources. NWF is in the process of thoroughly reviewing and critiquing the Administration's policy, and will provide a more detailed analysis for the hearing record within the next two weeks. However, it is important that we address certain aspects of its policy at this time.

NWF endorses the Administration's final rule closing the "ditching and draining" loophole in the U.S. Army Corps of Engineers regulations. Historically, many Corps of Engineers districts avoided regulating ditching, drainage and excavation in wetlands and other waters. The Corps based its failure to regulate these activities on the de minimis discharge exception in its permitting regulations. The exception created confusion and inconsistent treatment of regulated persons, while allowing the destruction of thousands of acres of wetlands. In 1990, the NWF filed suit under the Clean Water Act, challenging the unregulated drainage of hundreds of acres of valuable coastal-plain wetlands near Wilmington, N.C. In February, 1992 the Bush Ad-

ministration agreed to settle the lawsuit, primarily by proposing a change in Corps and EPA regulations to eliminate the de minimis loophole. The new ditching and draining rule stems from that agreement.

The NWF supports the Administration's withdrawal of the proposed Alaska One Percent rule. Due to the importance of this provision, enclosed in this testimony is a complete section devoted to the issue of Alaska's wetlands.

The NWF is pleased with the Administration's endorsement of a broad-based effort to restore the nation's historic wetlands base. It is important that the Administration supports appropriations for expansion of the Wetlands Reserve Program and also supports other voluntary and cooperative efforts to restore wetlands on private lands. Finally, the NWF endorses the Administration's commitment to training federal wetlands delineators in order to increase the reliability and accessibility of wetlands delineations.

NWF is opposed to many other aspects of the Administration's plan. The Administration has adopted a rule that arbitrarily exempts as many as 54 million acres of agricultural wetlands from regulation. Under Swampbuster, wetlands that were drained or otherwise manipulated to enable a farmer to plant commodity crops, before December 23, 1985, are considered "prior-converted." Farmers can farm these wetlands as they did in natural conditions or as they did prior to December 23, 1985, without penalty. Despite being cropped, many prior-converted wetlands continue to provide flood control, pollution filtration, groundwater recharge, wildlife habitat, and other wetlands functions. According to the 1989 *Federal Manual for Identifying and Delineating Jurisdictional Wetlands*, these areas frequently meet the definition of "waters of the United States" and deserve full § 404 protection. Moreover, almost all prior-converted wetlands would revert to wetlands if farming was discontinued. Swampbuster specifically recognizes that prior converted wetlands can be "abandoned." The Administration's rulemaking allows these cropped wetlands to be converted to commercial, residential and other uses. A relatively benign Swampbuster classification becomes a blanket § 404 exemption authorizing the permanent destruction of all existing and latent wetlands functions and values.

The Administration also proposes to make the Department of Agriculture's Soil Conservation Service the lead agency for the purposes of wetlands delineations on agricultural land under Swampbuster and the CWA. Although it makes sense to use a single delineation for both wetlands programs, SCS is not the federal agency that should be making these important jurisdictional decisions. SCS has far less experience than EPA and the Corps in delineating wetlands. In fact, SCS has a dismal record of accurately delineating wetlands on farm land. In southwest Kansas, for instance, SCS found only three wetlands in a seven county area that were subject to Swampbuster. These counties are part of the playa lakes region, an area known to have tens of thousands of seasonal and temporary wetlands. SCS has since agreed to *redo* the delineations in southwest Kansas and any other part of the state where similar inventory errors were made.

The Administration supports the development of state watershed management plans that would incorporate state and local standards for wetlands protection. Although watershed management is a tool that could be used to complement and improve the § 404 program, the Administration's proposal is a way to dismantle the wetlands regulatory program. Under the guise of state watershed management, the Administration proposes to loosen wetlands restrictions by allowing local governments, and even private entities, to identify and rank wetlands, devise expedited procedures for wetland development, and establish mitigation banks to "compensate" for wetland destruction. The Administration also proposes to give "high priority" to developing programmatic general permits (PGPs) that will "defer" to state and local governments implementing approved watershed plans. These proposals will continue a Bush era policy of aggressively and illegally transferring 404 authority to state and local governments. However, state and local governments are subject to intense political pressure, and should not be entrusted with the management of America's wetlands.

The Administration's proposed administrative appeals process would provide wetland developers ready access to challenge Corps and EPA wetlands delineations and permit denials, but would "shut out" neighboring and downstream landowners and other concerned citizens when they attempt to challenge wetlands delineation and permit approvals. This lack of equal access to an administrative appeals process is unfair and skews wetlands decisions in favor of wetlands destruction.

Like the Bush administration, the Clinton Administration promotes the concept of wetlands categorization. Wetlands deemed to be of relatively little value would receive reduced protection under the section 404 program. This proposal would facilitate the destruction of thousands of acres of wetlands in urban areas of the country.

At the same time, the highly technical and resource intensive process of assessing wetland functions and values would divert resources desperately needed by the Corps and EPA for timely and accurate wetlands delineations, permitting and enforcement.

Finally, the Clinton plan endorses the concept of mitigation banking. In practice, however, the establishment of mitigation banks encourages the destruction of wetlands because it makes mitigation requirements easier to comply with. Moreover, creating wetlands through mitigation banks, in order to replace wetlands proposed for new development, is extremely difficult and fraught with risk and uncertainty. At a minimum, mitigation banking should be restricted to "restoration" of wetlands, and never used for simple "preservation."

Alaska's Wetlands

The protection of Alaska's wetlands is another critical, albeit emotionally-charged and controversial, issue that must be of high priority and central focus for this Subcommittee. As with so many other facets of the wetlands debate, there is no shortage of misinformation, distortion, and "horror stories" being generated by those who seek to relax protection for Alaska's wetlands. Due to the importance of Alaska's wetlands and the continuous threat they are under, it is important that we specifically address this issue.

Following, we provide an overview of the many important functions and values Alaska's wetlands provide our Nation, a discussion of the ecological and economic significance of these habitats to Americans and to the international community, and an overview of the threats to Alaska's wetlands. This is followed by an in-depth discussion and analysis of what the Alaska Natural Resource Center and many of our colleagues in the environmental community consider to be the single most important wetlands issue facing Alaska: the Bush Administration's proposal to wholesale exempt Alaska from the Section 404(b) (1) mitigation requirements, oftentimes referred to as the "One Percent Rule" or exemption. Although the Clinton Administration formally withdrew this ill-conceived proposal as a part of its 24 August 1993 announcement, and we commend them for this action and for recognizing the importance of Alaska's Wetlands, there will be considerable pressure from the Alaska delegation and others to breathe new legislative life into the One Percent Rule.

An Overview of the Resource At Stake

America's largest state is also its wettest. Almost half of Alaska—170 million acres—can be classified as wetlands. With nearly two-thirds of the Nation's wetlands within its borders, Alaska boasts many of the most diverse and critical wetland habitats on the continent. The State's coastal estuaries, saltwater lagoons, river corridors, marshes, muskegs, bogs and wet tundra all support an astounding variety of fish and wildlife species. In fact, no complex of natural systems has had a greater influence than Alaska's wetlands in shaping the State's economy.

Alaska's Fisheries

Alaska's wetlands sustain some of the world's richest commercial and sport fisheries. Because the maintenance of customary and traditional lifestyles is dependent upon fish and wildlife resources sustained by wetlands, 200 of the 209 remote villages in Alaska are located in, or near, wetland ecosystems.

For Alaskans, fish are one of the most important natural resources critically dependent on the State's wetlands. Freshwater wetlands provide essential spawning, feeding, rearing and over-wintering habitat for all five species of Pacific salmon found in Alaska as well as trout, whitefish, grayling and pike. Wetlands also provide a valuable source of inland and marine detritus to coastal estuaries, supporting shrimp, crab and other shellfish as well as a number of commercially-important marine fish species. Alaska's wetlands are essential in maintaining water quality in salmon spawning streams and rivers and in nearshore spawning and rearing areas for marine fish and shellfish.

In addition:

- The gross revenues from harvest of salmon in Alaska exceed \$500 million annually [ex-vessel]. Gross revenues to processors exceed \$1 billion annually. The salmon harvest alone involves nearly 17,000 licensed vessels, over 500 processors and buyers, and more than 70,000 jobs.
- The seafood industry is the largest private industry employer in Alaska, accounting for more than one quarter of all the personal income generated by private industry in Alaska.

- As a result of the economic activity generated by the harvesting, processing and marketing of fish, every major region of the state is directly or indirectly affected by the health of the commercial fishing industry.
- Sport fishing in Alaska sustains a significant service industry. Anglers pay for tackle, boats, moorage, transportation, lodging, food and beverages, guiding, and other fishing-related goods. Collectively, sport anglers' annual expenditures in Alaska result in gross business revenues of approximately \$350 million, 5,000 full-time jobs, and \$115 million in personal income.
- Gross revenues, jobs and personal income generated outside Alaska by sport fishing in the state equal or exceed those generated within the state due to importation of goods and payment for goods and services occurring outside the state.
- Almost two-thirds of the annual subsistence harvest is composed of fish and shellfish. Subsistence fishing supplies over 20 million pounds of food annually to rural areas in Alaska.
- Fish provide a major portion of the diet of rural Alaskans. In comparison to the average American who consumes about 13 pounds of fish per year, the average rural Alaskan consumes approximately 230 pounds of fish per year.

Alaska's Wildlife

Many of Alaska's wildlife species, including moose, brown bear, caribou, beaver, mink and otter are dependent on Alaska's wetlands during some, or all, of their life cycle. These wildlife resources sustain a significant segment of the State's economy.

Similar to sport fishing, hunting in Alaska supports a broadbased service industry. Hunters pay for guns, ammunition and other equipment, transportation, lodging, food and beverages, guides and guiding services, meat processing and other related goods and services. Hunter expenditures alone contribute \$82 million annually in gross revenues to Alaska businesses.

In addition:

- Conservative estimates of the nonconsumptive values of Alaska's wildlife include over one-fourth of the \$400 million spent annually by tourists in the State. Aesthetically and biologically, wetlands generate a large portion of this revenue.
- Alaska's wetlands provide nesting, rearing and staging habitats for millions of waterfowl and shorebirds important to hunters and birdwatchers throughout the Nation. For example:
- Thirty-four species of waterfowl nest in Alaska's wetlands, including eight species that nest nowhere else in the United States.
- Eighty percent of the world's Trumpeter Swans and 50 percent of all Tundra Swans nest in Alaska's wetlands.
- Ten million ducks, 750,000 geese and 80,000 swans migrate annually from nesting grounds in Alaska to wintering areas in the lower 48 states, Canada, Mexico, and Asia. Another two million ducks and 300,000 geese depend upon Alaska's wetlands for critical staging areas.
- Alaska's wetlands support up to 60 percent of North America's Northern Pintail ducks, 25 percent of Wigeon, and nearly 20 percent of Scaup and Canvasbacks.
- Seventeen percent of all geese and 11 percent of all ducks harvested in North America are reared in Alaska's wetlands.

Finally, Alaska's wildlife comprise a significant component of the subsistence economies of the State's rural villages. Of the estimated 35 to 45 million pounds of food harvested annually by subsistence users, approximately 18 percent is land mammals [primarily wetlands-dependent species such as moose and beaver] and nearly eight percent includes waterfowl and wild plants. The remainder of the harvest includes fish, shellfish and marine mammals.

Alaska Wetlands Are At Risk

Despite their vastness, their critical role in supporting abundant fish and wildlife populations, and the significant contribution they make to the State's economy, Alaska's wetlands are at risk. Development and urban expansion threaten America's last remaining stronghold of expansive wetland ecosystems. In carrying out their aggressive attack on Alaska's wetlands, pro-development forces have tried to cleverly use the argument that, because Alaska's wetlands are more abundant than wetlands in the Continental United States, the regulations protecting them are unnecessary and far too stringent.

The truth is that, while Alaska's wetlands acreage is indeed vast, many critical wetland habitats are extremely limited in extent. For example, Alaska's coastal salt marshes—literally the cradle of an array of economically-important fish and shellfish species—comprise only 345,000 acres and are especially vulnerable because most of Alaska's urban development occurs in coastal areas. Despite blanket statements that Alaska is up to its ears in wetlands, losses in some parts of the State have been dramatic. For example, nearly 60 percent of Anchorage's original wetlands base and 30 percent of Juneau's Mendenhall Valley have been destroyed by development. These losses, in fact, exceed the national average.

Efforts to Legislatively Exempt Alaska from Wetlands Mitigation Sequencing [The "One Percent Rule"] Must Be Soundly Rejected

The NWF and numerous other national and local conservation and environmental organizations strenuously oppose revising the Clean Water's Act's Section 404(b)(1) guidelines to exempt Alaska from mitigation sequencing. Although the Administration formally withdrew from consideration the EPA proposal [57 Federal Register at 52716], we have every reason to expect that an aggressive effort will be made to seek a legislative remedy to this misperceived problem.

The Alaska One Percent Rule was proposed by the Bush Administration on the eve of the general election and was driven by politics, not science. The EPA has provided little evidence supporting the "assumptions" underlying this ill-conceived proposal and—in fact—are contradicted by the agency's own experts as well as those from other resource agencies who dispute the need to grant an exemption to Alaska.

As proposed, EPA would have provided a blanket exemption to oil interests and developers in Alaska to disregard cost-effective alternatives to wetlands destruction and avoid the requirement, applicable in every other state, that wetlands destruction be offset by compensatory mitigation. At a time when the Nation is striving for no net loss of wetlands it is inconceivable that the EPA would have granted the opening up of 1.7 million acres of Alaska's wetlands—an area larger than the state of Delaware—to development.

The proposed exemption would have unacceptable adverse effects on the environment.

The objective of the Clean Water Act is to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters." In fact, the EPA has explicitly singled out wetlands as a resource especially deserving of protection [see, e.g., 40. C.F.R. § 230.1(d)]. Special treatment for Alaska would strip protection from these "special aquatic sites" and, in so doing, flatly ignore the national and international importance of Alaska wetlands to fish, waterfowl, shorebirds, and marine and terrestrial mammals. Even the EPA's own experts in its Regional Office, and those of the U.S. Fish and Wildlife Service, have articulated compellingly that the loss of millions of acres of Alaskan wetland habitat as a result of the One Percent exemption would cause irreparable harm to the fish and wildlife populations that depend on these aquatic ecosystems.

The proposal to exempt Alaska wetlands from mitigation sequencing under section 404 would have severe negative environmental effects and, from a resource perspective, would actually undermine the objective of the Clean Water Act to preserve the waters of the United States.

The proposed exemption would have unacceptable adverse effects on the economy of the State of Alaska.

As discussed at length above, the wetlands of Alaska are a keystone to the State's economy. Thus, anything to erode or diminish the State's wetlands base will also diminish the health of its economy. This is because the State's commercial and recreational sport fisheries—which employ thousands of people and generate billions of dollars annually—would be put at risk by the exemption.

For example, the wetlands most critical to Alaska's fisheries and subsistence economies are also among its scarcest. According to the government, only 345,000 acres of the State's wetlands are vegetated estuarine or intertidal wetlands. These are precisely the rare and productive coastal wetlands that are the most vulnerable to urban growth and development. Thus, loss of one percent of the State's wetlands, as has been proposed, could entirely eliminate Alaska's coastal wetlands and the enormous and sustainable economic benefits they provide.

In summary, withholding full Clean Water Act protection from millions of acres of Alaska wetlands will have a negative impact on the functions and values of those systems. Because the Alaska economy relies, in substantial part, on the health of its wetlands, the economy would unquestionably suffer as well. In its barest form,

adopting the One Percent Rule would be an economic and an environmental disaster.

The premises underlying the proposed exemption are not supported by the evidence.

The chief premise of the One Percent Rule is that the section 404 program, generally, and the Section 404(b)(1) guidelines, specifically, are unacceptably rigid and burdensome to the regulated community operating in the state of Alaska. Thus, it is lamely argued that an across-the-board Alaska wetlands exemption is an appropriate remedy because [1] there is lack of practicable alternatives to developing in wetlands and [2] opportunities to perform wetlands compensatory mitigation in Alaska are extremely limited.

The NWF tested the underlying premise of the proposed exemption and its assumptions in respect to mitigation sequencing by serving Freedom of Information ["FOIA"] Requests on the Corps and the EPA. In evaluating the issue of unacceptably rigid and burdensome requirements, we requested, reviewed and analyzed documents establishing the implementation record of section 404 in Alaska during the past 20 years and all records justifying EPA's decision to protect wetlands in Alaska less stringently than in other states. The agencies' responses to our requests were striking and, by almost any standard, demonstrate beyond a doubt that the existing guidelines are already extraordinarily flexible and that the section 404 program is not an unreasonable impediment to wetlands development in Alaska.

In its request, NWF obtained all records indicating the number of section 404 permits processed, approved, and denied in Alaska in the 20 years since 1972. We also requested all records reflecting the number of occasions in which compensatory mitigation was required by the Corps. According to the government's own records, of the 3,997 individual permits processed by the Corps between 1 January 1972 and 15 October 1992, only 108 [2.7%] were denied. Of the 3,017 individual section 404 permits authorized by the Corps during that time, only 15 [0.5%] were conditioned on compensatory mitigation. Clearly, the Corps' records do not support the premise that the Section 404(b)(1) guidelines are unduly rigid in Alaska and require weakening. If anything, these data suggest the guidelines have proven too flexible to accomplish the important task of protecting the Nation's waters.

With respect to the second issue, that there is a lack of available upland sites for development, NWF submitted a FOIA requesting of EPA all records indicating that lack of available uplands sites has prevented development in Alaska. The EPA was unable to produce a single responsive document and—in fact—the agency actually produced four documents demonstrating quite the opposite, that "lack of available upland sites has not limited or prevented" development in the State. The contention that in many cases there are no practicable alternatives for development in Alaska except in wetlands is apparently an opinion with little basis in fact.

In a similar vein, EPA produced only slightly more evidence that compensatory mitigation is not feasible in Alaska because of technical difficulties and a lack of restoration sites. Our analysis of this issue is beyond the scope of this statement and can be read in the attached comments, but suffice it to say that the government has provided little hard evidence to demonstrate compellingly that developers are unable to compensate for wetland losses in Alaska.

In conclusion, although the proponents of the One Percent Rule argue that the section 404 program has been too restrictive in Alaska, that there are limited practicable alternatives, and that mitigation sequencing is impracticable, a thorough review of the administrative record compels the conclusion that these tenets are unfounded and largely without merit.

NWF Position on Alaska Wetlands

For the aforementioned reasons, NWF vigorously opposes the exemption of Alaska from the mitigation sequencing provisions of the Section 404(b)(1) guidelines. Our independent analysis of records from the Army Corps of Engineers plainly demonstrate that the section 404 program has been no more burdensome to the regulated community in Alaska than in any other state. However, should questions or uncertainties still remain concerning the application of section 404 in Alaska—particularly as it relates to permitting and compensatory mitigation—then we urge the commissioning of a Government Accounting Office investigation to develop whatever additional information might be warranted on Alaska wetlands and the section 404 regulatory program.

The flexibility already built into the Section 404(b)(1) guidelines has easily accommodated the "unique" Alaska circumstance of pristine and abundant wetlands. The Alaska Exemption would take an already flexible program and convert it into a giveaway. Adoption of the proposal by Congress would not only permit developers to

fill wetlands even when there are convenient upland alternatives, but as well ignore obvious opportunities for compensatory mitigation. The result would be the unmitigated loss of 1.7 million acres of Alaska's wetlands. This proposal simply cannot be justified, and we urge the subcommittee and the Senate to soundly reject efforts to legislate an Alaska One Percent Rule.

Summary and Conclusion

Wetlands provide many critical ecological functions and values that are of enormous benefit to all sectors of society. Those values and functions include: flood conveyance; storm surge abatement; water quality maintenance; habitat for endangered and threatened species and other wildlife; fish and shellfish habitat; recreational opportunities; water supply; food production; timber production; historic and archaeological sites; education and research areas; and open space and aesthetics.

Despite the economic, ecological, and sociological benefits of wetlands, wetlands have been destroyed throughout our history, and they continue to disappear today at an alarming rate. While defenders of the ongoing destruction of the nation's wetlands often cite narrow "economic" arguments to support their positions, any sound analysis of the wetlands regulatory protection program must include the broad ecological, economic, and social ramifications of further reducing America's valuable wetlands resource.

S. 1195 and H.R. 350 (The Wetlands Reform Act), introduced by Senator Barbara Boxer (D-CA) and Representative Don Edwards (D-CA) respectively, offer a balanced solution to the problem of wetlands protection that is flexible and fair. In contrast, S. 1330 (The Comprehensive Wetlands Conservation and Management Act of 1993), introduced by Jimmy Hayes (D-LA), is clearly designed to weaken or eliminate federal protection of wetlands. In light of the many important benefits that wetlands provide, any bill that would accentuate the decline and destruction of wetlands ecosystems must be disregarded as economic and ecological folly. The NWF appreciates the work of Senators Max Baucus (D-MT) and John Chafee (R-RI) in drafting S. 1304 (The Wetlands Conservation and Regulatory Improvements Act), but without significant improvements, such as those outlined herein, this bill too, fails in its mission to protect our wetlands heritage. Going beyond S. 1304, the Clinton Administration plan is fatally flawed. In exempting 54 million acres of prior-converted wetlands, proposing a one-sided permit appeals process, and endorsing the concepts of wetlands categorization and mitigation banking, the Administration has "balanced" wetlands right out of the policy equation.

With the reauthorization of the Clean Water Act this year, Congress can send an important message—that we will no longer tolerate the annual loss of nearly 300,000 irreplaceable acres of wetlands. Each day of inaction only exacerbates the problems we face today: polluted drinking water for our families, flood damage to our homes, collapsing commercial and recreational fisheries, and—perhaps most devastating—a downward spiral of biodiversity.

The time has come to pass a strong, effective national wetlands protection policy that has an explicit goal of protecting wetlands. We have allowed, indeed, encouraged, the destruction of more than half of the nation's heritage of wetlands. We now understand what has been lost and the values of the natural wetlands that remain untouched. We must not, in the name of political expediency, ignore the dismal consequences of continued wetlands loss to our nation's ecological and economic health.

Congress must take a leadership role, casting aside specious arguments, false horror stories, and political pressures, to rechart this nation's existing course of wetlands destruction. The course is clear and it remains only for a resolve to be translated into action.

TABLE 1: Anglers, days spent fishing, and expenditures in 1991 in states represented by Members of the Clean Water, Fisheries, and Wildlife Subcommittee

State	Anglers	Days Fishing	Expenditures
Connecticut	345,000	4,473,000	\$ 252,997,000
Florida	2,677,000	36,528,000	\$1,654,594,000
Idaho	365,000	2,878,000	\$ 145,456,000
Maine	449,000	4,552,000	\$ 177,931,000
Minnesota	1,450,000	17,701,000	\$ 846,246,000
Nevada	171,000	1,181,000	\$ 80,123,000
New Jersey	963,000	11,718,000	\$ 774,375,000
North Carolina	1,481,000	15,909,000	\$ 577,546,000
Pennsylvania	1,397,000	23,849,000	\$ 677,152,000
Rhode Island	171,000	2,056,000	\$ 63,523,000

**REMARKS OF THE FOUNDATION
FOR ENVIRONMENTAL AND ECONOMIC
PROGRESS BEFORE THE ENVIRONMENT
AND PUBLIC WORKS COMMITTEE
OF THE UNITED STATES SENATE**

SEPTEMBER 15, 1993

**Presented by
TED R. BROWN, President
Foundation for Environmental
and Economic Progress
c/o Arvida Company
7900 Glades Road
Boca Raton, FL 33434
(407) 479-1144**

INTRODUCTION

Mr. Chairman, Members of the Committee:

I am appearing before you today in my capacity as President of the Foundation for Environmental and Economic Progress, a coalition of large landowners and community developers which, while small in number, is nonetheless significant in the diversity and magnitude of their collective real estate holdings. The member companies have projects in 44 states in the United States. We share in common the ownership of large tracts of developed and undeveloped land for which there exists both a long-term commitment to develop and significant capital investment. Among the members are Newhall Land and Farming; Del Webb Corporation; Cargill, Inc.; Westinghouse Communities; Mobil Land and Development Company; Arvida Company; the Woodlands Company; Westvaco Company; and the Newland Group.

As I come before you today, it is acknowledged by all that wetlands and their functions are vital to a balanced ecological system and, as such, careful attention needs to be given not only to existing wetland areas but to the potential for enhancing, restoring and creating new wetland areas. Both Congress and the President are to be applauded for their movement into this arena, but it is extremely important that you and the President be bold as you collectively address the various competing interests and different policy choices confronting you in the wetlands arena. The failure to participate in this process in a meaningful way assures that there will be continued regulatory and judicial expansion of the program. Nowhere is this more evident than in the Final Rule proposed to settle the case of *North Carolina Wildlife Federation v. Tulloch*, Civil No. C90-713-CTV-5-BO (E.D.N.C. 1992). Here is a clear attempt by the

regulatory bureaucracy to expand the definition of "discharge" to include excavation, i.e., activities whose essential nature is removal of material from waters, not addition of material to waters. The Federal government is now attempting to regulate activities that affect wetlands by improperly using incidental soil movement as a jurisdictional "hook."

Let me be clear. The Foundation believes it entirely appropriate to expand the scope of activities regulated in a wetland, but for the Administration to suggest that Congress should amend the Clean Water Act to make it consistent with this rulemaking has the cart before the horse. Congress must decide; then agencies can adopt rules to implement that direction -- not the other way around. Without Congressional sanction, this program will ultimately lack political legitimacy and, if that occurs, the very proper goal of effective resource management will be undermined, as will the credibility of the program itself.

The direction suggested both by Senate Bill 1304 and by the President's policy initiative of August 24, 1993, moves in the right direction, but both fail to address several important issues. My focus is to highlight for you those areas where progress has been made as well as those where more remains to be done. We do so in the belief that the fundamental objective of the wetlands regulatory program is to provide a series of procedures and protocols that allow for the effective management and conservation of the resource but not at the sacrifice of the economic engine of this country and, in particular, the component part of that engine that is represented by the land development industry. What we believe is needed is a balance; one which rationalizes through creative planning the usefulness of selected portions of our wetland resources while excluding or severely restricting access to others.

NO NET LOSS

The President has articulated and we support the goal of "no overall net loss of the nation's remaining wetlands and the long-term goal of increasing the quality and quantity of the nation's wetlands resource base." While we acknowledge the validity of that goal, it is important to recognize that without fundamental change in the present 404 program, we do not believe it is possible to achieve the goal. The present 404 program, as it has been implemented by the Environmental Protection Agency and the Corps of Engineers, promotes a program that emphasizes strict and absolute protectionism as the preferred regulatory approach. This approach ignores two important concepts of the no net loss doctrine. First, the term "net" implies that there will necessarily be some losses to be offset by other kinds of gains. Second, the concept of "no net loss" has always been interpreted to mean no net loss of the "functions" and "values" of wetlands as opposed to the concept of no net loss of territory or land standing alone.

The President's policy remarks potentially leave open the question of whether or not no net loss is to be viewed as no net loss of function or value. We believe that the President's position, particularly when viewed in the context of the whole program, accepts the historical interpretation of no net loss, but we would urge both the Congress and the Administration to make that clear as they offer both legislative and regulatory guidance to the implementing agencies. The institutionalization of this concept is critical to the ability to increase the quality and quantity of the nation's wetlands resource.

**CONSOLIDATION OF WETLANDS ADMINISTRATION;
REGULATORY PROGRAMS MUST BE FAIR, FLEXIBLE
AND PREDICTABLE; DUPLICATION MUST BE AVOIDED**

An announced principle of the President's plan is that the regulatory program must be efficient, fair, flexible and predictable, and administered in a manner that avoids unnecessary impacts upon private property and the regulated public while providing effective protection for wetlands. Duplication among regulatory agencies must be avoided, and the public must have a clear understanding of regulatory requirements and various agency roles.

Substantially all of the efforts suggested by the President in implementing this particular aspect of his wetlands policy were directed toward the agricultural sector, with little relief being provided to the other portions of the regulated community. If we are serious about avoiding duplication and achieving a measure of efficiency, fairness, flexibility and predictability, then serious consideration must be given to consolidating the 404 program under one agency. The President, while not outright endorsing the concept, recognized the necessity for continuing to review this matter, for in the "Questions and Answers" distributed with the narrative of his plan, the President acknowledges that "the Administration will take steps to emphasize a single decision maker to streamline the various Federal wetlands programs and reduce duplication, overlap and delay . . ."

As each of you are aware, presently the Corps of Engineers is charged with the responsibility of issuing a permit, but the Environmental Protection Agency has the right to veto the permit or to elevate a permit decision for further review in Washington. The U.S. Fish and

Wildlife Service is a commenting agency which also has rights to request an elevation to Washington. Add to that additional layers of review in virtually every state, and it is not difficult to understand why consolidation at the Federal level should be addressed.

The tension that exists between the Corps of Engineers, the Environmental Protection Agency and the U.S. Fish and Wildlife Service results in an adversarial system in which the permit applicant is caught in the middle and is forced to engage in a process of shuttle diplomacy between the offices of these various agencies while he works the process through to completion. We have urged and would urge again that the Congress of the United States, give renewed consideration to consolidating the permitting process into one agency. Other agencies may, of course, be commenting agencies, but one agency should have the final authority to issue or deny the permit without having its paper graded by another agency at the same time. No one step would do more to promote efficiency, fairness, flexibility and predictability while at the same time eliminating much duplication of staff and expertise.

If this approach is politically impractical, then we would recommend a compromise that would allow the Environmental Protection Agency, if it certifies affected wetlands to be of national significance within 60 days of the filing of an application, to take over the permitting responsibility from the Corps for a particular permit application. Appropriate interagency guidance could be developed to more precisely define the criteria by which the EPA could take over a permit, but the intent is that it must be an application of major significance. If the EPA exercises its takeover authority, then it would have exclusive decision making power on the permit, and the Corps of Engineers would simply become a commenting agency for the balance

of the process. If, on the other hand, the EPA does not exercise its takeover authority, then the Corps would be the exclusive decision maker, and the EPA would be a commenting agency with no right of a veto or other right of elevation. This compromise effectively leaves in play the regulatory apparatus of both agencies, allows both agencies to continue to participate in the permitting arena, but allows the applicant, at a particular point in time in the process, to deal with one Federal decision maker and one set of managerial prerogatives.

The recently announced initiative which reestablished the Corps as the lead agency for permit review has proved somewhat useful, but it does not ameliorate the fundamental fact that as and to the extent the EPA is not a satisfied constituent, the Corps of Engineers is, as a practical matter, powerless to move forward until that constituency has been satisfied. Movement on this agenda is critical if we are to eliminate duplication among the regulatory agencies, and we would urge the Congress to refocus legislative effort on this issue.

ADMINISTRATIVE/JUDICIAL REVIEW

Significantly, both Senate Bill 1304 and the President's program move forward to provide additional protections to landowners in the areas of administrative and judicial review at various stages of the permitting process, and we applaud that effort. We believe, however, that some refinements are desirable in the interests of fairness and in the interest of leveling the playing field. The President's initiative to allow an administrative review of jurisdictional delineations is long overdue and clearly should be incorporated into any legislation coming out of the Congress of the United States. Senate Bill 1304 does not presently provide for the same, but

it is an extremely important concept that cries of fundamental fairness and assures a significantly increased level of accountability in the delineation of wetlands by those charged with that responsibility. We would urge in the strongest way possible that administrative review of jurisdictional delineations should be a part of the law and that the law should require that administrative review be conducted independent of the regulatory office of the Corps. Parochialism is, at best, a perceived threat to objectivity and, at worst, a real threat to objectivity. It cannot be ignored in this type of endeavor.

Senate Bill 1304 proposes a fundamental change in the review of permit denials, and we believe it inappropriate. As it is presently proposed, it would require that a permit denial must first be administratively reviewed prior to seeking judicial relief. Given the finality of a permit denial and the impact that it has upon a landowner, we believe that a landowner should have the right to pursue either of these alternatives. The necessity for administrative review, however, is an important plus that ought to be available to a landowner, and it should, therefore, be retained but not at the expense of immediate judicial review. If the issues which give rise to the denial of the permit are perceived as negotiable, they may well be able to be resolved in the administrative review format. On the other hand, if the issues which gave rise to the denial of the permit are issues for which there is little chance of compromise, it may well be that the only perceived recourse available to the applicant is through the courts. In that case, the applicant ought not have to expend another six, nine months to a year in the administrative review process before he can seek judicial relief from a decision he considers adverse to his interests. So, we

would urge that at the point in time that a permit is denied, a landowner would have either option available; administrative review or access to the courts.

DEADLINES FOR PERMIT APPLICATION

The President's initiative, as well as that of Senate Bill 1304, suggests the establishment of deadlines for wetlands permitting decisions under the Clean Water Act. Interestingly, the regulatory apparatus presently in place provides for similar deadlines, and while they seem to add some sense of predictability, satisfying a public that craves predictability, they, in reality, do not work. No one who has spent the time and effort to get an application to the public notice stage wants the application denied simply because the deadline has been reached, and absent one of the triggers for extension, that outcome is virtually assured. The issue is, how do you create a framework for making timely decisions which advance the process to a place where a permit decision can be made. While deadlines may contribute to that framework, we would strongly urge that in every instance, the applicant be given the right to waive the 90-day period in order to keep the applicant's application alive and subject to continued review and processing. Assuming the applicant is actively engaged in addressing regulatory comments and is in good faith pursuing the obtaining of a permit, arbitrary deadlines controlled by the government are counterproductive. However, the applicant should always be able to call for a decision and, once called for, obtain one within 90 days. These concepts should be included in Senate Bill 1304.

GRANDFATHERING: SEC. 7(3)(B); SECTION 7(e)(5)

The proposed language of Section 7(3)(B) of Senate Bill 1304 is problematic to the extent that it voids either an existing General Permit or one which has been and is being actively pursued simply because "a unit of government" over which a private party has no control has failed to become "part of a wetlands and watershed management plan approved under Section 322" by 12/31/96. The Foundation has a number of members who are currently involved in negotiations with ACOE, EPA, USFWS, together with state and local agencies pursuing an ACOE General Permit. Hundreds of thousands of dollars have already been expended in reliance on the validity of the presently existing regulatory scheme. It would be blatantly unfair to preclude a validly and legally adopted General Permit to remain in effect simply because another arm of government has not complied with the new policy direction in a timely way. The potential for abuse is great and, accordingly, "remain in effect" should be deleted from Section 7(3)(B).

Additionally, predictability requires consistently applied standards. Section 7(e)(5), which terminates General Permits after five years, should be rethought. We find no merit in arbitrarily terminating General Permits simply by reason of the lapse of time. In contrast, we would recommend that they be automatically renewed every five years provided the conditions of the original General Permit have been satisfied and there is no affirmative showing by the Government that material changes have occurred which require different treatment.

CLASSIFICATION

Turning to the issue which we believe to be most critical to the rationalization of the 404 process and to creating a framework that attracts private capital to the restoration of wetland resources, we believe the failure of Senate Bill 1304 to address classification and the President's somewhat lukewarm endorsement of the concept needs to be rethought.

On a positive note, the Administration's acceptance of the notion that not all wetlands are created equal and that permit applicants deserve "a timely and predictable regulatory response that is appropriate for the project being proposed" are important first steps which are to be applauded and encouraged to be made a part of a Congressional response.

Unfortunately, neither the Administration nor Senate Bill 1304 go far enough to recognize the absolute necessity for developing a mechanism for wetlands classification. On the one hand, the President suggests that "the prior categorization and ranking approach would not provide for consideration of the individual impacts associated with specific projects" and uses that as a rationale for concluding that national classification is not an agenda item for the Section 404 program. However, in the same breath, the Administration supports, as does Senate Bill 1304, the concept of advanced planning which, if implemented with the rigidity that has characterized our experience with the Advanced Identification program, will also "not provide for the consideration of individual impacts associated with specific projects."

We would suggest that both extremes are missing the point and that the development of classification criteria that are watershed specific can be done, and when done, can be determined

simultaneously with a jurisdictional delineation. Classification is the essential linchpin to extrapolating private capital to accomplish the fundamental objective of not only restoring degraded wetlands but increasing the wetland inventory beyond no net loss. The notion that lesser value wetlands should receive some measure of expedited permitting authority, while antithetical to the environmental agenda, is nonetheless an important tradeoff if we are to bring to bear market driven forces to encourage the restoration of lower value wetlands with higher value wetlands and to steer development activity away from those resources which are of higher quality and ought, in all fairness, be immune from the pressure of development. If such a program were implemented with replacement ratios determined by function and value that required compensatory mitigation to exceed 100% of the function and values being impacted, then the system will return more in wetland function and value than was taken away, and it will do so without tax revenues. In short, it imposes market-driven sequencing and delivers private capital to wetlands restoration and enhancement by directing development to low value wetlands in exchange for restoration and enhancement mitigation.

The President's approach seems to hint at moving in this direction, but the regulatory guidance which emerged as a result of this direction continues to impose a set of applicant-driven prerogatives which are rigid and considerably more inflexible than the President's approach would have suggested. The President's approach also suggests that as a precondition to the imposition of a classification system, there needs to be watershed level analysis within specified regions of the country that take into account the unique ecological characteristics of those regions. We do not disagree with that approach, but a few words of caution are appropriate.

A watershed planning process should be planned to establish the sizes, types, and locations of wetland/upland complexes that have the potential for long-term survival as functioning ecosystems. This type of analysis does not have as its goal the rigid classification of wetlands for permit purposes, but, in like manner, it does not seek to classify wetlands for long-term preservation purposes either. In this context, it is entirely appropriate to consider not only the ecological consequences of wetland classification, but the economic and political consequences as well.

Our experience has been that when the classification process gets too far in front of a permit application, it inevitably develops a rigidity that constrains creative solutions, giving rise to enormous expense and delay in attempting to work through more precise and accurate data in an effort to overcome what has become intentionally or unintentionally the "official map." It immediately denies any prospective future development use to the parcel and is inconsistent with the stated implementation of the 404 permit review which implies that a "public interest balancing" will occur only when an immediate and certain use for the site is identified. It can be argued, of course, that advanced classification is itself a balancing process, but all lands are not ripe for development at the same time, and it is for that reason that the President's comments are well taken when he again, and I repeat, points out that "prior categorization would not provide consideration for individual impacts associated with specific projects." It is also true that prior classification designed to limit access to lands is also burdened by the same constraint.

What we believe is needed is a comprehensive and holistic look at the needs of a particular region which are overlaid with the wetlands agenda, but it is not so precise as to

specifically take out of play any particular wetland resource, and Congress should encourage and appropriate funds to accomplish this study. This approach avoids premature conflict between the landowner and the government and recognizes that environmental resources and wetlands in particular, are fluid. That is, they will change over time. They will either improve, get worse, or stay about the same but, clearly, change is inevitable. When the watershed analysis is complete, then joint consideration of a variety of factors can lead to a classification system for application to individual permits. Significant, among others, are:

- 1) The magnitude of the ecological value to the watershed of the wetland site proposed for development, if developed is denied. This would be analyzed considering (a) how the site might in the future be isolated or fragmented from the watershed system even if the permit is denied; and
- 2) the scarcity of the wetlands type in the watershed; and
- 3) the difficulty and cost of restoring or creating lost functions, in relation to their ecological value, if development on the site is accepted.

In this alternative, wetlands classification is undertaken on a case-by-case basis and, as such, does not confront the takings problems over the entire watershed. Importantly, it allows the permit application to be evaluated in the context of the existing dynamics within the watershed and, as such, allows for consideration of individual impacts associated with the specific application. At the same time, it imposes a classification on the targeted wetland that will be determinative of the level of regulatory attention that is to be focused on the application.

For example, for low value wetlands impacts, the applicant can move immediately to mitigation. For medium value wetlands, some showing of how the applicant addresses practicable alternatives and sequencing would be required, but the application would be viewed holistically, and the mitigation component would be considered simultaneously. For those wetlands that are of high value, rigid sequencing and rigid practicable alternatives would continue to apply.

Such a system uniformly assures that market-driven capital would be attracted to low value wetlands, and if impacted, the tradeoff is mitigation provided and paid for by the applicant. Private capital will not move to high value wetlands except in extreme cases and, as a result, avoidance will be accomplished through the market. The restoration of low and medium value wetlands will occur with private capital and will advance the agenda of "net gain" while allowing some measure of development.

The system that presently exists and is still being implemented through the recent regulations just enacted on August 23 does not move in this direction. Senate Bill 1304 does not deal with classification of wetlands or the establishment of protocols for developing the same. Until we can move to a system in which it is recognized first that all wetlands are not the same and develop procedures for permitting around that reality, then the regulated community remains confined and constrained by a process in which there is no relaxation of the permitting standards irrespective of the quality of the resource being impacted and irrespective of efforts to inculcate flexibility where none has existed before. We would urge serious reflection on these notions.

MITIGATION BANKING

Both the Administration and Senate Bill 1304 are to be commended for their recognition of mitigation banking as a part of the solution and not a part of the problem. While that recognition is explicit, there is not much in the way of substantive direction that is provided for in either the Senate Bill or in the President's remarks and subsequent regulatory guidance. Of particular concern is the seeming inability to come to grips with a fundamental reality -- that mitigation banking is not going to happen in any meaningful sense with private capital until there is created some set of incentives that allows it to attract private capital. In this context, let's be clear what I mean by a mitigation bank. I do not mean a large wetland area developed by a permit applicant for internal mitigation credit. I regard that not as a bank but simply as a credit reserve for a particular applicant. A mitigation bank, in my parlance, is a restoration or enhancement effort of a degraded or almost defunct wetland to which unrelated third parties may gain access for mitigation credit by the payment of cash and, once obtained, may go forward with an unrelated project, provided other regulatory requirements are satisfied.

To my knowledge, only two such banks exist presently in the United States, and the jury is a long way from out on whether or not they will be successful. The tendency of the regulators to require that all mitigation be done, in place and functional before credits can be withdrawn is totally unworkable from any practical point of view. For those who would seek to invest in a mitigation bank, a requirement that it be totally successful before credits can be sold essentially means that the credit suppliers bear all risks and costs of mitigation failure.

Those costs are too high for any kind of a competitive return on investment, and for a market-based trading system to work, suppliers must be allowed to sell credits from mitigation sites that are not yet fully mature or even self-sustaining. Stated differently, the ability to sell the mitigation credits must be moved back on the demand/supply scale where some element of risk is assumed on the regulatory side of the equation. That risk can be minimized in some ways by appropriate bonding mechanisms and the like, but it is wholly inappropriate if we hope to attract private capital to this type of a venture to assume that it will be accomplished without strong economic incentives to do it. The developer would be, and clearly is, much better off to simply make a permit application and process his requirements for mitigation simultaneously with the permit application. If he is successful in achieving the permit, the mitigation component will be defined, and he will install it and build it in accordance with the permit application, all contingencies being satisfied simultaneously. The other mechanism is a high risk gamble which no one, in my understanding, would undertake other than other governmental agencies such as road departments, counties, municipalities, school boards and the like which do not have to earn returns on capital and do not have the same attendant risk associated with the expenditure of that capital as does the private sector.

SECTIONS 321, 322 AND 323

The development of State Wetlands Conservation Plans pursuant to direction by the Federal government is obviously important to bringing continuity and predictability to the

regulatory process. Given our strong endorsement of "classification," the Foundation would urge that Section 321(b)(2) be amended to read as follows:

(b)(2) An inventory of wetlands resources in the State which includes criteria for classification of function and value.

The necessity for public input and the failure to provide for the same have been areas of great concern among the regulated community, particularly as the 404 program has matured in recent years. Accordingly, the Foundation believes that Section 322(a)(3) should provide that the Governor will make his determination under this section "after notice and opportunity for public comment."

In like manner, the regulated community has inappropriately been excluded from the policy making arena in favor of weighted panels of government employees and technicians. Given the accepted fact that somewhere between 75% and 85% of the nation's wetlands are in private ownership, we believe the proposed Intergovernmental Wetlands Coordinating Committee should have private property owner representation and recommend, therefore, that a subsection (c)(10) be added to Section 323 as follows:

(c)(10). Ten private property owners selected and appointed by the Administrator from among nominations submitted by the Governor of each State.

CONCLUSION

On balance, we remain pleased that the Congress of the United States and the President are beginning to aggressively address these issues and believe that much has been accomplished. There is a unique opportunity at this particular point in time to structure a regulatory resource

management apparatus that not only works but will attract capital to accomplish the fundamental objective of adding to the nation's wetland inventory. The environmental agenda is admittedly suspect of that notion, but the other mechanism, which is a command and control regulatory apparatus designed to frustrate even a modicum of cooperation between government and the private sector has not proved workable, and implicit in both Senate Bill 1304 and the President's plan is a recognition of that reality. I would urge you to be creative, to go beyond the bounds of normal rhetoric and to, in the words of the President, "reinvent government" in a way in which it responds to the need not only to manage the resource but to encourage market-driven incentives to restore and replenish the resource.

Respectfully submitted,

Ted R. Brown, President

INAPPROPRIATE

STATEMENT OF KEVIN C. MARTIN, PRESIDENT, SOIL AND ENVIRONMENTAL SERVICES, INC.

I will keep my statement short in order to allow more time for questions, which in my opinion are normally the most productive part of these hearings. Forty percent of my work is wetland related. I have a B.S. in Conservation, and a M.S. in Soil Science with a mirror in Hydrology. I currently chair the Technical Committee of the National Society of Consulting Soil Scientists, I am on the Wetland Restoration Committee with ASTM, I assisted in testing Wetland Manuals in 1991, and I am on the NC Wetlands Rules Committee.

1. I come as a hands-on field person who, on a daily basis, deals with wetlands, delineation, mitigation, permitting etc. And therefore, my comments are based on my experience in dealing with the 404 program. Unlike a lot of the testimony I have heard in these and other hearings, I will stick only to aspects of the program I have first hand experience with.
2. In general the White House Policy and S. 1304 (the Chafee-Baucus Bill) takes steps in the right direction to clarify this murky issue. In fact, I am pleased to see that some of the specifics that many of us presented during the White House Interagency Task Force meetings have been incorporated into the current Policy Statement.

3. However, I do have several concerns related to those and other wetland issues.

A. An appeals procedure for both delineation and permitting is a necessity. This should be by persons not involved in the original action, possibly from an adjacent Corps district, since the original regulator involved would not have an unbiased opinion.

B. A value rating system is a must for a reasonable wetland program. However, the one proposed by the White House, (HGM, Hydrogeomorphic Classification System, developed in NC) would have to be significantly modified to work. It identifies types and kinds of wetlands but not in a way that their functions and values can be "ranked" into high, medium and low. It only results in high and medium categories. Other systems like those developed by the N.C. Division of Environmental Management, Water Quality Planning, Wetlands Group have been utilized and shown to work effectively. This has enabled me or anyone else who utilizes the system to have a feel where we stand instead of having to attempt to read a government employee's mind.

C. Corps Districts are too free to develop policy or opinions that can in many cases significantly change their authority. They should be *required* to follow DC guidance, otherwise property owners on the same type area in different districts do not get equitable treatment. In N.C. The Corps has approached this matter reasonably.

However, I have seen a site in Rhode Island where a "significant impact" existed according to Corps and permits were denied even though USF&WS and the state Environmental Agency approved the project. Later, on the very same site, the Corps issued permits which impacted much more wetland than the first, while still maintaining the first was significant and the latter were not.

D. Development of regional indicators of hydric soils by the Soil Conservation Service is *dangerous* and USDA should rename or drop this project. It was originally titled Regional Indicators of Soil Saturation. You cannot reduce an entire field of science to a 2 page list of indicators. No one has proposed doing this for vegetation criteria so why do it for soil? It seems that some of the agencies do not want to require their personnel to be trained thoroughly in all parameters of wetlands. If you want to water down soil science you will have to accept huge errors one way or another in delineations. If persons performing delineations are properly trained, there is no need for this list.

E. Continued funding of NWI maps makes no sense, they are not accurate enough for wetland delineation and by their own admission, do not even use the same criteria for wetland delineation as required in the 404 program. These funds could be better used elsewhere. For example, funding exists for states to set up wetland programs but once set up, no money is available to help run the program. This money could be better utilized in the application of such programs.

F. Proposed funding to map all wetlands in the U.S. is ridiculous. Senators should consider costs and need for this. Who will do it, how, where will qualified persons be found, how long will it take and at what cost? There is no need to map wetlands on property unless there is a proposed change in the use of property. The EPA has already funded projects in various states for mapping wetlands

- that will not be accurate enough for Corps use. Why not divert these funds to running state programs?
- G. Contrary to popular belief agricultural land is not exempt from wetlands regulation. In fact it is subject to two sets of regulations: Swampbuster and 404. This can have drastic impacts to continued operation of existing "noncommodity" crop farmland.
- H. Delineator certification is a good idea for the private sector and government personnel involved in wetland programs. Currently anyone who wants to claim to be a wetlands expert can. I have seen some catastrophic results due to unqualified persons practicing in this field.
- I. There is currently no consideration for project size in permit approval. This leads to small, piece-meal, poorly planned projects that attempt to avoid regulation rather than comply, because compliance is not practical for many large projects under the current regulations.
- J. I have been very disappointed in hearings of the past and in government testing and formulation of criteria for wetland delineation because of the absence of field persons with hands-on experience from the private and public sector in all relevant fields of science. After all, if anyone knows the problems with the current and past manuals, it is those who daily utilize them in the field.

The biggest drawback I have seen to the almost exclusive reliance on academics and office-based government employees, is that they are often not in touch with reality. There is a need for academics on the "cutting edge" of technology to work together with experts who have extensive field experience delineating wetlands utilizing the various manuals. Unfortunately the NAS Committee is very top heavy on the academic end.

Ironically the NAS is also *completely* devoid of experience in the field of soil genesis, morphology and taxonomy even though soils is one of only three criteria that make up wetland delineation criteria. A balanced committee of 18 would therefore seem to warrant at least 4 to 6 soil scientists with expertise in Soil Taxonomy. I do not see how any workable recommendations can come from NAS without their having qualified soil scientists on the committee.

- K. I would strongly recommend you and your staffs spend some time in the field to learn more about some of the types of marginal areas we are currently dealing with in many cases. I doubt any of you would believe that such areas are wetland or should be protected by the Clean Water Act. A system utilizing consideration of values in permit decisions or a reasonable change in the delineation manual if done properly will lead to protection of truly high quality wetlands.

STATEMENT OF DAN JAMES, FEDERAL AFFAIRS REPRESENTATIVE,
PACIFIC NORTHWEST WATERWAYS ASSOCIATION

The Pacific Northwest Waterways Association (PNWA) is a regional association that has been working for 59 years to maintain the multiple use concept in the development and management of the Northwest region's natural resources.

PNWA membership includes 149 organizations and individuals in Idaho, Oregon and Washington. PNWA represents:

- Public port authorities on the Pacific Coast. Puget Sound, and Columbia/Snake River Systems;
- Public utility districts, investor-owned utilities, and direct service industries;
- Irrigation districts;
- Grain growers, grain grower cooperatives, and upriver elevator companies;
- Major manufacturers in the region;
- Forest products industry manufacturers and shippers; and
- Transportation providers, consulting engineers, and others interested in the economic vitality of the Pacific Northwest.

Our Association thanks the Subcommittee for this opportunity to share our vision of wetlands program reform with you and your colleagues.

PNWA created a Wetlands Committee nearly a year ago to study the variety of issues that will be discussed during reauthorization of the Clean Water Act. The Committee offers an expansive range of expertise, including wildlife biologists, water quality specialists, natural resource attorneys, a former high ranking Administration wetlands regulatory official, port staff and utilities staff. This group prepared the following testimony on S. 1304 and has accomplished a review of the Administration's recently announced wetlands policy objectives.

Wetlands Regulation Needs to be Incorporated into the Land Use Planning Process

The states in the Pacific Northwest have a well deserved reputation for their high quality comprehensive land use planning. We believe that sound land use decisions have resulted from our local and regional comprehensive plans.

Under previous federal policy, federal wetlands regulation occurred after local land use decisions had already been made, significantly reducing the predictability for public and private landowners. PNWA has been seeking to improve the process by giving local jurisdictions the option to include federal wetlands delineation and alternatives analysis much earlier in their comprehensive land use planning process.

Description of the Problem. Most Northwest cities and counties develop land use plans to guide both development and preservation. Land is zoned for natural preservation, residential, commercial, industrial and other purposes. That process is generally open to the public, and local and federal governmental agencies participate in the development and review of the plans. The problem arises after the planning process is completed when a public or private landowner seeks to develop its property. For example, public port authorities own a substantial portion of their communities' industrial or marine industrial zoned property. It is not until a client has been identified and the port seeks to develop its industrially zoned property, after all other land use decisions have been made, that the federal wetlands process begins. Often, it results in a portion of the port's industrial property being delineated as wetland, which reduces the community's inventory of industrial property and reduces the ability of the local community to meet its economic needs.

PNWA's Solution. PNWA is proposing amendments which would provide that state and local land use planning processes, subject to certain criteria and subject to ongoing Corps of Engineers or Environmental Protection Agency oversight, would, at the option of the local jurisdiction, trigger the federal regulatory process. For those states with effective land use planning processes, federal wetlands regulation should be integrated into the local planning process. The presence or absence of wetlands would be considered along with all other factors in determining appropriate zoning for all classes of activity. If wetlands are present for any given class of zone, alternatives would be analyzed and the zone would be located in the most appropriate location as part of the alternatives analysis. Once the land use plan is adopted, the alternatives analysis required by the National Environmental Policy Act will be deemed to have been satisfied. Upon completion of an approved mitigation schedule, if required under the plan, development appropriate for the zone may occur.

This Approach Works. The State of Oregon provides an example of how this might be applied. Oregon has established a land-use planning goal for the preservation of natural resources. In Oregon's planning process, criteria are developed and natural resources are inventoried. The plans are implemented so as to protect the identified resources. Rules established by the State lay out a procedure for identifying conflicting uses. This involves determining the "economic, social, environmental and energy (ESEE) consequences" of the proposed use. The local planning jurisdiction is then responsible for classifying the site according to its ESEE. Management directives include hill protection for sites with high ESEE values, limiting conflicting uses to balance the ESEE or, in certain cases, allowing the conflicting use without restriction.

Incorporating Wetlands Regulation into the Land Use Planning Process

Section 12, 322(b)(1)(F) sets criteria for Wetlands and Watershed Management Plans "to integrate wetlands planning and management with broader water resource and land use planning and management. . . ." We agree with this approach. However, we propose to take this concept one step further by offering local jurisdictions three options:

1. To proceed under the current regulatory programs, under which development actions would be permitted individually.
2. To develop a land use plan which meets the requirements of a Wetlands and Watershed Management Plan. Which, upon completion, is approved by the federal government, or
3. To allow local jurisdictions to elect to initiate the federal regulatory process, including sequencing and alternatives analysis for land use classes, as a part of their local land use planning process. The result of this cooperative process would be the issuance of a Programmatic General Permit for development, protection and mitigation activities consistent with the plan.

We believe that this will increase the quality of local land use plans, increase the certainty of implementing the land use plans adopted by local jurisdictions, increase

the certainty of protection for valuable wetlands and increase the certainty that local communities will be able to meet their economic development needs.

We are pleased to submit, for your consideration, concept language that will increase the capability of local jurisdictions to achieve the policies and goals of S. 1304, as stated in Section 3. Our draft language, entitled "PNWA Concept Language, section 404 Amendments" is attached.

Comments on Other Provisions of S. 1304

PNWA endorses many elements of S. 1304 that will help local jurisdictions meet local and federal objectives for both protecting wetlands resources and meeting the economic needs of our communities and the nation. Among those elements are:

1. Sec. 4(b) Delineation of Wetlands. We support the continued use of the 1987 Wetlands Delineation Manual until the National Academy of Sciences has completed the study of wetlands authorized by Public Law 102-389.
2. Sec. 6 Permit Processing Improvements. PNWA supports the establishment of deadlines for issuing permits.
3. Sec. 9 Mitigation Banks. We support the establishment of mitigation banking as a form of advanced compensation for development.

There are some key sections of the bill for which we are suggesting modifications. They include:

1. Sec 5(2) The Term Fill Material. . . . The definition, by including "any material," is too broad. We propose replacing this definition with the definition of fill material in the Corps of Engineers and Environmental Protection Agency's Final Rule published in the August 25, 1993, Federal Register.
2. Sec. 6 Permit Processing Improvements. (c) Administrative Appeal of Permit Decisions. This section appears to allow the appeal of all provisions related to the issuance of a permit. This is likely to be an unreasonable drain on federal staff resources and prohibit the agencies from meeting the deadlines specified elsewhere in Section 6. We propose the bill be amended to include the Administration's policy regarding appeals, which would limit appeals to determination of regulator jurisdiction, permit denials and administrative penalties.
3. Sec. 8 Coordination and Clarification . . . (c) Other Exempt Waters and Areas. We agree that the items on the list of areas that shall not be considered to be navigable waters are appropriate, but we propose adding the following after (4)(A)(vi), "(vii) confined dredge material disposal areas constructed in uplands."
4. Sec. 9 Mitigation Banks, (2) Definition. PNWA agrees with the definition, but would go one step further, adding an expressed preference for using mitigation banks over on-site mitigation. We agree with the Administration's policy statement which states that mitigation banking "offers numerous advantages," including greater certainty of success, consolidation of fragmented mitigation projects and other benefits. (See attached PNWA Concept Language.)
5. Sec. 12, 322(d)(4) Programmatic General Permits. PNWA endorses the codification in law of Programmatic General Permits (PGP's), however, we propose to broaden the authority to issue PGP's to include activities consistent with approved state or local land use plans. (See attached PNWA Concept Language.)
6. Sec. 12, 323 Intergovernmental Wetlands Coordinating Committee. We agree with the need to integrate federal, state and local wetlands policies and planning, but we are concerned that the establishment of this Committee will drain the resources of the regulating agencies and will prohibit them from meeting other requirements of the Act, including meeting permit deadlines.

There is one issue that is not included in S. 1304, which we propose adding. There needs to be more flexibility in the permitting process to adjust the regulatory requirements based upon differences in wetlands functions and values. PNWA believes that this is a necessary improvement, and it is included in the Administration's wetlands policy.

PNWA greatly appreciates this opportunity to present our views on wetlands reform to the Subcommittee. We look forward to working with the Subcommittee throughout the Clean Water Act amendment process.

PNWA CONCEPT LANGUAGE, section 404 Amendments

The policy of the United States is to preserve and protect wetlands for their benefits to wildlife, flood control, water quality and other natural values. The Congress recognizes that a sound wetlands protection policy must permit responsible public, private, commercial and industrial activity. Current policy impedes development of land because Federal wetlands regulation occurs after local land use decisions have been made. Thus, an area may be designated under state and local law as suitable

for commercial or industrial development, yet Federal wetlands review and alternatives analysis would not occur until a specific development project is proposed. The result is uncertainty and delay. The Congress finds that land development and wetlands protection can better be reconciled if the Federal wetlands permit process is integrated with state and local land use planning and approval processes.

1. To assure continued coordination and to provide stronger Federal recognition and participation in the state and local land use planning process, the Secretary will publish final regulations within 180 days of enactment of these amendments that set forth specific criteria which at the option of the state and local governments may be used when preparing land use plans, watershed management plans, wetlands conservation plans and other similar, comprehensive plans and reports.
2. To the maximum extent practicable the Secretary shall ensure that the 404(b)(1) guidelines are satisfied in the state and local planning processes, including the alternatives analysis and mitigation requirements.
3. When requested by the state or local planning agency, the Secretary will cooperate fully and provide the staff resources necessary to ensure that the final plan will satisfy the Federal requirements under both NEPA and section 404 of the Clean Water Act.
4. Upon submittal by a state or local government, the Secretary shall review state and local plans for consistency with specific criteria set forth in the final regulations published in accordance with Paragraph 1, above, and approve or reject the adequacy of the plans within 180 days of submittal.
5. Within 90 days of approval of the state or local plan, the Secretary will implement programmatic procedures which will provide the section 404 authorization for specific activities that are consistent with the state or local plan.
6. After notice and opportunity for public hearing, the Secretary may issue Programmatic General Permits and Procedures including for example State Program General Permits (SPGPs), Local Program General Permits (LPGPs), or provide Abbreviated Processing Procedures (APPs) to authorize activities within the Secretary's jurisdiction.
7. Programmatic General Permits and Procedures are preferable approaches to case by case permitting of activities which the Secretary deems consistent with state or local land use plans or comprehensive plans prepared by Federal, state, or local governments or their respective agencies, port districts, river authorities, or similar entities.
8. Programmatic General Permits and Procedures may be used to authorize a wide variety of activities, provided the Secretary determines that the activities, including any appropriate and practicable mitigation, will have minimal cumulative impacts to the watershed.
9. Full compensation for wetlands can be provided by mitigation banks which have been approved by the Secretary to provide mitigation credits.
10. When the Secretary determines that full compensatory mitigation will be provided by a mitigation bank or site specific mitigation plan, the Secretary may waive the requirement for an off-site alternatives analysis for those wetlands which the Secretary determines to be low value. This provision satisfies the alternatives analysis required by both NEPA and the Section 404(b)(1) guidelines.
11. Credits from approved mitigation banks should be used as compensatory mitigation for low-value wetlands when available and practicable. Compensatory mitigation from approved mitigation banks when available is preferable to compensatory mitigation built during or after the wetland fill.

**STATE OF ALASKA TESTIMONY
STATEMENT OF COMMISSIONER JOHN A. SANDOR
COMMISSIONER
DEPARTMENT OF ENVIRONMENTAL CONSERVATION
TO THE
SENATE ENVIRONMENT AND PUBLIC WORKS COMMITTEE
CONCERNING WETLANDS POLICY**

SEPTEMBER 15, 1993

ALASKA WETLANDS ISSUES

HISTORY AND STATUS:

Regulations for Alaska's wetlands should be tailored to the arctic, sub-arctic and coastal ecosystems and related to the sustainable development objectives of the State. In many of the lower 48 states, wetlands were inadequately protected and are now a scarce resource. Some states lost most of their wetlands. In contrast, Alaska has substantial wetlands - with minimum estimates of 130 million acres - more than the entire 48 states combined - and to date, 99.85 per cent of these wetlands remain.

Land ownership, restricted development opportunities and the unique arctic-subarctic environment also differentiate the Alaska wetlands situation from the rest of the United States.

Approximately 87 per cent of Alaska is in public ownership; 55% in federal ownership, where most development activities are prohibited or carefully regulated. Approximately 12 per cent of Alaska is Native owned with only the remaining 1 per cent privately owned. Private lands have very limited development opportunities compared to other states because of the lack of developed energy sources, very limited surface transportation systems and small population base (less than 600,000). Even agriculture is limited with less than 100,000 acres of the State's 375,000,000 acres in agricultural production or use.

Up to 80 per cent of Alaska can be classified as wetlands. The nature of the arctic - subarctic environment and climatic conditions create extensive interior permafrost and muskegs which cover millions of acres. Most of Alaska's 200 rural Alaska Native communities are located in the midst of areas classified as wetlands which will have to be developed if these communities are to achieve and sustain acceptable economic and environmental objectives. 135 of these Native villages lack basic water and sanitation systems, and the development of such facilities will require discharge of dredge or fill in wetlands.

Less than two tenths of one per cent (0.15%) of Alaska wetlands have been developed. This compares to the National average of 53 per cent. The other 49 states have developed from 20 per cent in Maine to 95 per cent in Ohio. Although a minuscule percentage of Alaska's wetlands have been developed, Alaska has a number of programs in place to preserve and protect high-quality wetlands.

Particular attention has been given to protection of anadromous stream corridors and coastal areas. For example, a large portion of the Bristol Bay drainage basin (Bristol Bay is the world's most productive salmon fishery) is protected by a State Park, Wood-Tikchik, which is the largest state park in the United States. Alaska has led the effort to buy back federal oil drilling leases off the Bristol Bay coast. Alaska has a vested interest in protecting its fishing industry. Proof of its success is demonstrated

by the fact that most commercial salmon harvests have been at high or record-breaking levels the last ten years.

Special protection of coastal areas and many inland areas such as the entire North Slope is provided by the Alaska Coastal Management Program (ACMP) which encompasses 43,000 miles of shoreline. The ACMP environmental protection standards prohibit development unless an applicant passes a practicable alternative test, a water quality test, and demonstrates a significant public need for the proposed project.

Because Alaska has already taken special measures to protect its unique wetlands and related resources, and less than two tenths of one per cent of its wetlands have been developed, imposing the same restrictions on Alaska that are imposed on the conterminous 48 states would be burdensome and unfair. The imposition of such restrictions would retard the sustainable development initiatives underway in rural Alaska Native villages and other communities. In fact, the larger communities and entire State's sustainable development potential would be severely restricted.

RECOGNITION OF ALASKA'S UNIQUE WETLANDS SITUATION:

The National Governor's Association recognized Alaska's unique situation and unanimously adopted the following statement:

"Finally, the Governors believe the national strategy should recognize the unique situation encountered by the State of Alaska...Because of certain geographic characteristics unique to the state (it is arctic and subarctic, with development constrained to limited geographic areas), policies and procedures that are reasonable in the conterminous states are not always applicable in Alaska..

The Governors recommend that the appropriate government agencies and stakeholder groups in Alaska work cooperatively to develop regional wetlands strategies that accommodate sustainable wetlands protection and economic growth for the state."

In recognition of Alaska's unique circumstances, the Environmental Protection Agency issued proposed regulations (1% rule) providing limited exceptions from National policy. These regulations have not yet been finalized.

It should be noted that the proposed 1 per cent exception IS NOT a blanket authorization to fill wetlands. The proposed exception leaves in place the Corps of Engineers permitting process. Through its mitigation authority, the Corps can require

that project size and configuration be altered to minimize adverse impacts on the environment.

Compensation - creating or restoring wetlands - is inappropriate in a state that has a low loss rate, limited uplands and substantial natural wetlands. In effect, compensation would require converting limited natural upland habitat into artificial wetlands.

BURDENSOME NATURE OF ALASKA WETLANDS PERMIT PROCESS:

Due to the abundance of Alaska wetlands, the federal government, through the wetlands permit program, controls an inordinate amount of local land use. From Barrow to Ketchikan there is frustration with federal control of local land use. The nature of the permitting process is that it is not necessary for regulators to deny a permit in order to stop a proposed activity. Denials often result through extensive delays in the permit process. In a survey of Alaska communities, fifty-one of fifty-three communities reported wetlands problems due to federal conflicts with local land use.

STATE OF ALASKA POSITION:

Standards developed for wetlands protection in the lower 48 states are not appropriate for Alaska's arctic, subarctic and coastal ecosystems, and the communities and cultures associated with this environment. The proposed one per cent exception is logical, because it maintains wetlands protection through the minimization requirement, and provides a total cap on losses.

The State of Alaska is already working to identify high-value wetlands which can be protected through no-net-loss compensation requirements. The State is also working with the Native villages and other communities to develop safe water and sanitation systems and the related infrastructure required for sustainable development.

We encourage federal agencies to enter into a partnership with the State of Alaska and its communities to cooperatively develop wetland strategies that are tailored to Alaska's ecosystems, and are consistent with the joint commitment to sustainable development.

STATE OF ALASKA'S PARTNERSHIP PROPOSAL:

When one considers that Alaska's land ownership pattern is:

FEDERAL: 208 MILLION ACRES - 59 PERCENT
STATE: 104 MILLION ACRES - 29 PERCENT
NATIVE: 44 MILLION ACRES - 12 PERCENT
PRIVATE: 5 MILLION ACRES - 1 PERCENT

The classification, management and protection of lands and resources, can most effectively be accomplished through a partnership arrangement between the local, state and federal governments and the involvement of Alaska Native and private land owners.

The desirability of a partnership arrangement is particularly evident when one looks at the ownership patterns on a land status map. Certainly, fisheries, wildlife, other resource and environmental values are not restricted to government boundaries. Add to this, the mix of the large and small cities, and the rural, Alaska Native villages and one must conclude that the people's needs and values are very closely related to that resource base. One of Governor Walker Hickel's favorite expressions is that people, people's needs and nature must be considered in the management of a country, region or state.

Alaska proposes a partnership with the federal agencies, somewhat along the lines of the arrangement already formed through the Alaska Rural Native Village Water and Sanitation Task Force and the Alaska State Rural Development Council. The Task Force is co-chaired by the State, Environmental Protection Agency and the City Manager of the community of St. Paul in the Pribilof Islands. The Council is a partnership of the State (and all its components) with the U.S. Department of Agriculture.

The goals of a wetlands partnership would enable communities to meet their economic and environmental protection needs; to define these needs and values and to develop a plan to sustain them over time. This, in my view, is what sustainable development is all about.

Alaska proposes, therefore, that the federal, state and local communities of Alaska develop a wetlands classification, management and protection partnership process integrated into this broader sustainable development objective.

Amendment Concepts for S. 1304

1. MITIGATION BANKING CREDIT

Any banking effort must be designed to reward good behavior for wetlands protection and give incentives which cause states to protect wetlands. Those states having a good record or meeting certain performance standards on wetlands protection would not be burdened with the same mitigation requirements of a state with severe wetlands loss.

For instance, states which have contributed land to federal and state parks, refuges, preserves and wilderness areas would be provided with an advance credit of X percent of the protected acres in the mitigation bank, provided they have a low historic loss of wetlands.

Any compensatory mitigation requirements attached to a Section 404 permit would be deemed to be satisfied by debiting, on a like wetlands value basis, the advance mitigation credit. Only when that credit was exhausted would actual on-the-ground compensatory mitigation occur.

Alternatively, in order to focus on wetlands only, any state which has protected X percent of its wetlands could be entitled to a mitigation banking credit of Y.

2. HIGH-LOW RANKING SYSTEM

A strict regulatory regime designed to aggressively protect "remnant " wetlands is not warranted where substantial or abundant wetlands remain unused or protected.

A national regime which classifies wetlands into high, medium or low value categories should be established. High-value, scarce wetlands would remain subject to a strict regulatory regime akin to the Section 404 program. Conversely, low-value wetlands or wetlands of any value which are abundant would be granted more regulatory flexibility.

A further step would be to set up expedited permitting in those states which retain over 50 percent of the original wetlands in each category, again providing an incentive to protect or restore wetlands to that level.

3. EXEMPTION FROM MITIGATION REQUIREMENTS

This would provide, under certain circumstances, that a state is exempt from the upland alternatives presumption and the compensatory mitigation step of sequencing. Eligibility criteria for the exemption could be as follows:

- a. any state with X percent of its original wetlands still intact;
- b. any state that has X acres or more of protected wetlands;
- c. any state that has more than 50 percent of its lands in public ownership and more than X percent of those lands committed to conservation purposes; or

A variation would provide that only "high-value" wetlands in certain states remain subject to the alternatives analysis and compensation step. All other wetlands within an otherwise eligible state would be exempt.

4. STATE TAKE-OVER WITH EXPANDED FLEXIBILITY

This option envisions inducing states to manage Section 404 program by enabling them to run programs with fewer restraints than provided by the current COE/EPA program. A qualified state program would preempt federal regulation, but individual permits would be subject to federal review or veto. COE/EPA would be barred from taking back the program unless they can affirmatively demonstrate that the state is failing to properly administer its program.

5. SECTION 404 JURISDICTION

Enact into law a definition of jurisdictional wetlands that incorporates the original 7th Circuit ruling of the Hoffman Homes case. This would exempt isolated wetlands from the reach of Section 404. Most coastal wetlands, as well as those along major rivers and streams, would still remain subject to Section 404.

6. ANCSA LANDS CONCERNS

Section 404 unfairly diminishes the value and purpose of lands which were part of the federal government's aboriginal lands claims settlement in Alaska, conveyed under the Alaska Native Claims Settlement Act (ANCSA) in 1971. This problem should be recognized and corrected, since village and regional corporations were given the land for community needs, including expansion and development, and have no alternative but to use those lands. Any action which unfairly impacts native lands or de-values them should be removed from consideration in this bill.

7. RURAL COMMUNITY CONCERNS

Although wildlife habitat is important, the Alaska National Interest Lands Conservation Act (ANILCA) set aside tens of millions of acres of the best Alaska habitat wetlands in 1980. At the same time, more than 200 Alaska villages still reflect Third World living conditions, in particular with regard to water and sewer facilities. Basic human health needs must be given adequate status in Alaska.

S. 1304 should enable human health needs to have an overriding priority, especially in any state where wetlands preservation efforts have been significant, where wetlands are abundant, or where practical alternatives to utilizing wetlands are scarce, limited or non-existent.

Thank you for the opportunity to submit these comments for the record on S. 1304. Briefing papers on each topic of concern outlined above are available and will be sent to the Committee as mark up on the bill begins.

WRITTEN TESTIMONY OF ARCO

Mr. Chairman, members of the Subcommittee, ARCO appreciates the opportunity to testify on S. 1304, the Wetlands Conservation and Regulatory Improvements Act, introduced by Senators Baucus and Chafee. ARCO agrees with Senator Chafee that any amendments to wetland protection regulation should result in enhanced effectiveness, fairness and flexibility. We think Congress can provide a legislative solution to eliminate the unnecessary delays and confusion that continue to encumber the wetlands permitting process. For the past decade, EPA and others have attempted to solve this problem by continually modifying regulations which were never originally intended to protect wetland habitats. We have the opportunity now to adopt new legislation for wetland permitting that will specifically provide both protection of wetlands and flexibility sufficient to allow appropriate development to continue.

ARCO's comments and opinions have been prepared principally by Mike Joyce, Senior Consultant for Biological Sciences for ARCO Alaska, Inc. Mr. Joyce is a trained wetlands scientist with a Master's Degree in Zoology. For the past 23 years, 19 of which have been in Alaska, he has participated in a wide variety of wetlands research projects. In Alaska, this research has focused on the study of wetland habitat values, fish and wildlife habitat use, site mitigation and restoration, and wetland classification and functional assessments. Mr. Joyce has also monitored the response of wetland habitats and their fish and wildlife populations to the development of North Slope oil fields since 1974. Mr. Joyce is a respected expert in wetlands biology.

ARCO's comments relate primarily to Alaska, but they also touch on concerns in the lower 48 states. This testimony focuses on four important wetland protection issues:

- The need for a wetlands policy that recognizes regional classifications based on value as an important and necessary element. All wetlands are not identical. They vary not only in size and function but also in relative value.
- The use of general permits, which ARCO supports.
- The use of mitigation banking which is appropriate for use in the lower 48 states, but not for Alaska.
- The need for a special approach to mitigation in Alaska. Alaska is unlike any of the lower 48 states. Much of the State is comprised of wetlands and there has been relatively little development. Mitigation procedures appropriate for use in Alaska are necessarily different from those appropriate for the lower 48. ARCO recommends basing Alaska mitigation rules on the 1981 U. S. Fish and Wildlife Service mitigation policy.

REGIONAL CLASSIFICATION AND CONTROL

ARCO believes any new wetlands legislation should recognize regional wetland differences and provide a clear mechanism for local authorities to determine appropriate actions within their regions. The situation in Alaska is illustrative of why this is so important. The White House Wetlands Task Force recognized the unique conditions in Alaska. The vast abundance of wetlands there, combined with the low availability of sites for mitigation, justifies alternative regulatory treatment. Consequently, the Task Force proposal calls for appropriate means to ensure regulatory flexibility and an alternative permitting procedure in Alaska. S. 1304 discusses the benefit of regional conditions and permitting flexibility in a general sense. We believe this bill can be greatly enhanced by specifically recognizing and authorizing regional classification of wetland habitats.

In addition to regional classification, we believe it is necessary to tie any requirement for mitigation to the regional abundance of each of the classified habitats. Without classification and mitigation based on value and abundance, we don't believe any legislation will successfully reduce the current controversy.

ARCO also agrees with environmentalists, regulators, and others who advocate that wetland decisions should be based on sound science and local conditions. For this to occur, several questions must be answered in each region. How abundant are wetlands in a particular region? What are the cumulative losses to date? What are the projected future losses? How are those wetlands being used to support local fish and wildlife populations? Are those populations being stressed? What other functions do the wetlands provide? Wetlands protection policy must address these questions in order to mitigate any losses of the functions provided by wetland areas that are or have been developed.

Finally, we favor permitting decisions at the local level without EPA veto authority. The existing veto authority clouds wetland permitting without adding meaning-

fully to the process. EPA has vetoed only 11 permit decisions in over 150,000 reviewed during the past 21 years.

GENERAL PERMITS

We endorse S. 1304's use of general permits (GP's) and believe it will enhance the regional flexibility we all seek. However, the bill appears to contain a contradiction. Under S. 1304, GP's are to be used to cover activities that are recognized as having only minimal adverse environmental effects. It appears, however, that compensatory mitigation could be required for any activity authorized under a general permit. Requiring compensatory mitigation for each action authorized under a GP should not be necessary, since GP's cover only those actions which have minimal environmental impact. Requiring mitigation will reduce, rather than enhance flexibility. We suggest eliminating compensatory mitigation from the general permitting provisions of the bill.

MITIGATION BANKS

S. 1304 calls for creation and implementation of mitigation banks to be used where individual applicants have difficulty achieving in-kind and on-site compensatory mitigation. However, the bill requires that in order to bank replacement habitat, the bank must be fully established in advance of authorizing any future proposed developments. For projects that have to begin in the next 3 to 5 years, it is not possible to provide replacement habitat in advance. It will likely take that long to authorize, locate, design, and implement mitigation banks. In Alaska, completion of successful replacement habitat will then take an additional 5 to 8 years. It is not practical to stop all development until this replacement habitat is fully functional. We support the use of mitigation banks in the lower-48 states, where substantial wetland loss has occurred. However, due to the conditions in Alaska, we do not believe a bank is necessary and, under any circumstances, should not require completion of replacement habitat in advance.

MITIGATION POLICY IN ALASKA

Alaska is a region where wetlands are abundant and not being depleted. The difficulty is not that we have few wetlands left, but that we have a state dominated by wetlands with few alternative upland sites to use for development. In fact, there are about 170 million acres of wetlands in Alaska. The rest of the state is mostly mountain slopes and ice fields. Additionally, about 99% of the state is owned by government authority. These facts greatly complicate the wetlands permitting process in Alaska.

Some of the difficulties involved in compensatory mitigation in Alaska are demonstrated by the following hypothetical development on the North Slope of Alaska. ARCO has announced the discovery of a potentially commercial oil find in the Beaufort Sea about 60 miles east of the existing Prudhoe Bay oil fields. This reservoir is about 12 to 18 miles offshore. If this prospect is economically viable, a pipeline would need to come on shore at the nearest land fall and then proceed across the North Slope coastal plain to tie into the existing facilities at Prudhoe Bay. In addition to the pipeline itself, a gravel road would follow the pipeline route. This route lies in an area that has been classified as jurisdictional wetland by the Corps of Engineers and is part of a large contiguous wetland habitat that is 37 million acres in size. Thus the project will necessarily be located in wetlands.

If compensatory mitigation were to be required for the pipeline, there are no disturbed footprints or upland habitats in the vicinity of the pipeline route to provide in-kind, on-site replacement. The only disturbed areas are the existing oil fields 60 miles to the west. However, these sites are already subject to restoration requirements and, therefore, are not available for mitigation credits. Thus, there are no on-site locations available for compensatory mitigation for this new project. Additionally, if ARCO were required to use a mitigation bank with mitigation credits created in advance, this project would be delayed for up to 10 years waiting for development and completion of the replacement habitats.

Furthermore, we know that not all of the wetlands on the coastal plain have equal values and functions. They include a wide diversity of habitat values. As indicated above, the permitting process also needs to recognize those different values and encourage location of facilities on the least valuable habitats. Without classification and mitigation based on value and abundance, there is no incentive for an applicant to locate facilities to avoid higher value areas.

Although we do not believe the mitigation bank system in S. 1304 can be used effectively in Alaska, we believe there is an alternative, acceptable approach. It is based on a program already in existence, the U. S. Fish and Wildlife Service Mitiga-

tion Policy finalized in 1981. The fundamental principles of this policy are based on the notion that: 1) avoidance or compensation should be recommended for the most valued resources; and 2) the degree of mitigation should correspond to the value and scarcity of the habitat at risk. In implementing its policy, the Service established four wetland resource categories: 1) high value and unique or irreplaceable ; 2) high value and scarce in the region; 3) high value but abundant within the region; and 4) medium to low value. The Service applies a mitigation requirement to each of these values, ranging from no loss of habitat value for the top categories to minimized loss of habitat value without further compensation for areas that are of medium value or are abundant in the region.

A program based on these concepts will work in Alaska. It provides flexibility and the recognition that, in Alaska, where we have few upland sites to turn to, we still need to build schools, airports and other public facilities, as well as explore for and produce oil.

Mr. Chairman, thank you again for the opportunity to testify on the wetlands regulatory program. ARCO has extensive experience with development in Alaska, and we would hope that this experience would prove useful to you as you consider wetlands regulation. We will be happy to provide any additional information you may need.

CHAMBER OF COMMERCE
OF THE
UNITED STATES OF AMERICA

WILLIAM T. ARCHEY
SENIOR VICE PRESIDENT, POLICY
AND CONGRESSIONAL AFFAIRS

1615 H STREET, N. W.
WASHINGTON, D. C. 20062-2000
202/463-5417

September 15, 1993

The Honorable Bob Graham
Chairman
Subcommittee on Clean Water, Fisheries and Wildlife
Committee on Environment and Public Works
United States Senate
Washington, D.C. 20510

Dear Mr. Chairman:

The U.S. Chamber of Commerce, the world's largest federation of 215,000 businesses, 3,000 state and local chambers of commerce, 1,200 associations, and 68 American Chambers of Commerce abroad, appreciates this opportunity to present its views on S. 1304 and related proposals regarding this nation's wetlands policy. The Chamber appreciates your leadership and that of Senator Chafee and welcomes S. 1304, "The Wetlands Conservation and Regulatory Improvements Act," as a constructive step toward Section 404 reauthorization. We respectfully request that a copy of this letter be included in the hearing record.

Any reform of wetlands policy should include the streamlining of the permit process. For too long, people have lost substantial resources because administrative and regulatory agencies have been slow to issue permits. The provisions in this bill, including the 90-day limit on permit decisions and the greater use of general permits, would enable landowners and businesses to plan for the future without unnecessary and costly delays.

Furthermore, the bill's relief for agriculture is timely and necessary. By making the Soil Conservation Service the lead agency for agricultural wetlands, S. 1304 recognizes the importance of having a regulatory agency that is sensitive to the needs of production agriculture. In addition, the exemption for prior converted croplands is consistent with the policies of the previous administration. Also, full funding of the Wetlands Reserve Program will ensure protection for some of this nation's most valuable wetlands.

We appreciate S. 1304's recognition that wetlands have different values and functions. Wetlands differ in their relative value, and this must be taken into account by regulatory agencies when making permit decisions.

In addition, the Chamber believes that mitigation banking — a market mechanism with the potential to minimize the economic impacts on individuals — will help resolve the wetlands debate. By allowing property owners to trade reclaimed wetlands for building on a specific site, there will

be greater flexibility in the system, and therefore, a more efficient means of protecting this nation's wetlands.

The Chamber welcomes the recent administrative proposals, which are consistent with S. 1304 and which further contribute to the resolution of the wetlands debate. Specifically, a return to the use of the 1987 delineation manual, in which all three traditional indicators of a wetland — saturation for 21 days, hydric soils, and hydrophytic vegetation — are necessary for such classification, will ensure a balance between wetlands protection and economic development.

While the Chamber agrees with the Clinton Administration's position on the treatment of prior converted croplands, mitigation banking, and permit process streamlining, we have concerns regarding other provisions in both the Administration proposal and S. 1304. Both seek to use state and local watershed management programs to assess the values and functions of wetlands rather than having the regulatory agencies decide. Although this may increase the flexibility of landowners with regard to developing low-value wetlands, it will not ensure that the regulatory agencies will abide by the decisions of the local planners. The Clinton Administration believes that the cost of mapping all the nation's wetlands will be prohibitive. The Chamber believes, however, that a general classification system would greatly reduce arbitrariness in the decisionmaking process, and can be completed within budgetary limits.

The sequencing process currently used, and outlined in the Administration proposal, is long and costly. A landowner must seek alternate sites, minimize environmental harm, and then compensate for the damage to the wetland. This approach is a long and unnecessary delay to the individual's use of private property. In addition, each time an agency prohibits an individual from developing private property due to the presence of wetlands, the agency, in effect, commits a regulatory "taking," and the owner should be justly compensated.

The Chamber thanks you and the Committee for taking significant steps toward resolving the wetlands debate. We look forward to working with you to ensure that the final version of Section 404 is one that provides the protection that is warranted for the preservation of our wetlands, but does not unduly burden or restrict landowners.

Sincerely,

William T. Archey

The Honorable Senator Max Baucus, Chairman
Senate Environment and Public Works
Subcommittee on Clean Water, Fisheries and Wildlife
SD-456 Dirksen Senate Office Building
Washington, D. C. 20510-6175

Dear Senator Baucus:

The Confederated Salish and Kootenai Tribes of the Flathead Nation have reviewed Senate Bill 1304, titled "the Wetlands Conservation and Regulatory Act". The Tribes take a special interest in this legislation because some of the best examples of glaciated wetland habitat located in the intermountain west are located within the boundaries of the Flathead Indian Reservation. The Tribes have long recognized the importance of this wetland habitat and have taken special measures to protect and preserve the integrity of these areas.

Enclosed with this letter please find technical and policy comments on the proposed legislation. We wish to ask the Subcommittee to accept these comments as the Tribes' testimony on the legislation. Hopefully, these comments will be utilized by the Senate Environment and Public Works Subcommittee on Clean Water, Fisheries and Wildlife in amending some of the provisions of the legislation to incorporate concerns that the Tribes hold with regard to the present version.

The Tribes appreciate the opportunity to provide testimony on this important piece of legislation. If questions arise regarding the contents of this testimony, please do not hesitate to contact me.

Sincerely,
Confederated Salish and Kootenai Tribes

Michael T. Pablo, Chairman
Tribal Council

TESTIMONY OF THE CONFEDERATED SALISH AND KOOTENAI TRIBES

SENATE BILL 1304
"WETLANDS AND REGULATORY IMPROVEMENTS ACT OF 1993"

The Confederated Salish and Kootenai Tribes of the Flathead Nation wish to provide testimony on the contents of Senate Bill 1304, titled "The Wetlands Conservation and Regulatory Improvements Act of 1993". The Confederated Salish and Kootenai Tribes take a special interest in the conservation of wetland resources because of the significant wildlife and fisheries habitat values they provide, their functions in improving water quality, their flood control capabilities, their groundwater recharge functions, and their recreational value.

The presence of some of the last and best examples of glaciated wetlands within the Intermountain West and a realization of the importance of such areas within the exterior boundaries of the Flathead Indian Reservation led the Tribes to adopt the Tribal Aquatic Lands Conservation Ordinance in 1987. That ordinance established a mechanism to slow the rapid pace of wetland conversion on the Reservation and created a review and permitting process for project proposals. The Tribes have applied for "treatment as a state" for purposes of Section 404, and the Tribes' ongoing concern for wetland resource values has resulted in Tribal initiatives in wetland inventory and classification and conservation. Initiation of work on the development of a wetland conservation strategy for the Flathead Reservation is presently in the early stages of planning.

The Confederated Salish and Kootenai Tribes applaud the efforts of Senator Baucus and Senator Chaffee in attempting to resolve some of the controversies that have occurred with respect to wetland issues. Language contained in Senate Bill 1304 sets the stage for resolution of some of these controversies. However, some of the other components of the legislation raise significant technical and policy concerns for the Confederated Salish and Kootenai Tribes. These concerns are detailed below.

The Tribes' primary concerns with the language contained in Senate Bill 1304 involves the nearly total lack of consideration of the jurisdictional concerns of Indian Tribes and the lack of specific language to allow Tribal governments to play active roles in wetland conservation planning, oversight, cooperative ventures, training opportunities, funding grants, conservation incentives, and restoration efforts. This is cause for major concerns for Tribes, especially in light of the fact that many pieces of environmental legislation do contain language in reference to Tribes and Tribal interests. Some of the examples include the Clean Water Act, the Clean Air Act, and the Safe Drinking Water Act. In addition, there is no stipulation for representation of the interests of Indian Tribes on the Intergovernmental Wetlands Coordinating Committee. By

essentially ignoring these concerns, the legislation disregards the Federal government's trust responsibility to Indian Tribes established by the various treaties entered into by Tribes and the United States. We remind you that Indian Tribes take the language contained within these treaties very seriously. In general, we recommend that Indian Tribes be added to the language of the bill to all sections which specify activity by state and local governments.

As written, Senate Bill 1304 contains the following language about which the Confederated Salish and Kootenai Tribes are concerned:

Sec.3 Declaration of Policies and Goals

The term "all levels of government" is ambiguous. Although it should be assumed that this language includes all departments and agencies of Federal, Tribal, State and local government, clarification is needed. We recommend amending Sec. 3 as follows: "(8) ...involving all levels of government, including Tribal governments".

The term "no overall net loss of the remaining wetlands resource base of the United States" can be defined as mandating an acre-for-acre replacement of wetlands lost to various development activities, yet this approach is not clearly stated. In many areas, acre-for-acre replacement is in fact inadequate. The bill's language should not limit wetland replacement to that formula.

Sec. 4 Definition and Delineation of Wetlands

Continued use of the 1987 Corps of Engineers Wetland Delineation Manual is mandated. The use of the 1987 manual may be acceptable for the short term, but it should be noted that the primary reason for development of the 1989 version of the manual was that the 1987 manual was deemed inadequate in scientifically-based wetland delineation criteria and more was considered to be too subjective. Use of the 1989 manual would be more acceptable, as well as more defensible based upon scientific merits. In fact the 1989 manual was based upon the best available scientific information; and it did take into account regional variations in hydrology, soils, and vegetation.

We recommend amending Sec. 4 as follows: "(2) (A) be developed in consultation with interested States and Indian Tribes".

We agree with the concept of standardized training of wetland delineators, but we would like to see the inclusion of Tribal

delineators along with consultants, and State and local government personnel as eligible for training and certification. Before agencies can instruct the general public regarding wetland delineation, there is a need to assure that agency personnel know how to delineate a wetland. This situation does not seem to uniformly exist today. Thus, standardized methodologies are essential during the early stages of redesigning this process.

Sec. 6 Permit Processing Improvements

In general, we support the language and processes included in Section 6; however, we recommend that the language be amended to reflect the role that Indian Tribes can play in these processes. As a result, we recommend amendment of Section 6 as follows: "(4) (C) ...the Governor of the State, or the Chief Executive Officer of the Indian Reservation in which the activity occurs ...".

Sec. 7 General Permit Improvements

We recommend amendment of Sec. 7 as follows: "(2) Categories of Activities. General permits may be issued on a State, Reservation, regional, or national basis...".

Sec. 8 Coordination and Clarification of Program Concerning Agricultural Activities

The language regarding prior converted cropland is a concern because it seems to totally disregard the thousands of acres of once productive wetland that have been lost to agriculture. A methodology is needed to attempt to reclaim the wetland values of at least some of these lands and to protect "farmed wetlands", which still exhibit wetland characteristics.

We recommend amendment of Sec. 8 as follows: "(d) (F) resulting from any activity with respect to which a State or Indian Tribe has an approved program ...".

Sec. 9 Mitigation Banks

The Tribes recommend that the Administrator and the Secretary's rules for mitigation banking include Indian Tribes along with States in the list of entities properly authorized to operate such banks, upon submission of approvable plans.

Sec. 12 Wetlands Conservation, Management and Restoration

We recommend amendment of Sec. 12 as follows: (A). "Funding

For State and Tribal Wetlands Conservation Plans. - Section 104 (b) (3) (33) U.S.C. 1254(b)(3) is amended by inserting immediately before the semicolon"and for the development and implementation of State and Tribal wetlands conservation plans under Section 321."

Sec. 321 State Wetlands Conservation Plans

We recommend amending the title of Sec. 321 to " State and Tribal Wetlands Conservation Plans". We also recommend inclusion of the following language.

"(a) ...grants to States and Indian Tribes to assist in the development and implementation of wetlands conservation plans..."

"(b) Contents of Plans. To qualify for assistance under subsection (a), a wetland conservation plan shall generally include:

- (1) management strategies and policies for achieving within the State or Indian Reservation, as applicable, the goal expressed in Sec. 101(a)(8);
- (2) an inventory of wetland resources;
- (3) a description of the major causes of wetland losses and degradation in the jurisdiction, including an estimate of historic wetlands losses;
- (4) a description of State, Tribal, and local government programs applicable to wetlands resources in the jurisdiction;
- (5) identification of sites with wetland restoration potential;
- (6) identification of riparian areas with restoration potential;
- (7) ...a schedule for implementing the elements of the plan;
- (8) ...a mechanism for monitoring achievement of the stated goals of the plan
- (9) ...measures to assist in the development of wetlands and watershed management plans under section 322, and
- (10) involvement of individuals and organizations with expertise or interest in wetlands conservation, land use planning and responsible development."

Sec. 322 Wetlands and Watershed Management Plans

This is perhaps the area of our gravest concern, primarily because as it is now written, local conservation districts appear to be eligible to obtain "management authority" over any area designated by the Governor of a State. Our lengthy litigation history with a local irrigation board serves as an excellent

example of the problems that tribes might face should they have to accede to "substate regional planning organizations". As a result, we recommend that this entire section be rewritten to recognize that Governors cannot unilaterally delegate such authorities, at least on Indian reservations, and that Tribal Chief Executive Officers can perform that function, if they so choose, on reservations.

We specifically recommend that Tribal governments be included in the eligible governments list at (f) Research Program.

Sec. 323 Intergovernmental Wetlands Coordinating Committee

Under this sections, we recommend that Tribes be accorded the proper government-to-government relationship with the federal government by inclusion of the word "Tribal" between "federal" and "State" in (a), first sentence and in (4), add "or Tribal" after "State" and at (c) Membership, include qualified representatives of Indian interests. We further recommend that the number of State wetland experts to be appointed by Governors be reduced to five and that five such experts be appointed by Indian Tribal governments. In addition, we fail to see a constructive legitimate role which might be played by the National Association of Counties or National League of Cities, both of which ought to be fairly well represented by the National Governors' Association and the State wetland experts. We also recommend that a qualified Indian representative serve as co-chair of such a group.

Sec. 324 National Cooperative Wetlands Strategy

We recommend the inclusion of the word "Tribal" after "State" and before "regional" at (c)(1).

In conclusion, the Confederated Salish and Kootenai Tribes believe that there is a need to achieve consistency among the various governmental agencies that delineate and regulate wetlands. However, this need should be tempered by the need to develop sound scientifically-based methodologies for delineation, as well as the need to treat all qualified governments with the proper respect. We also believe that Indian Tribes throughout the United States can and should be allowed to play a role in this national effort to conserve and manage the wetlands resources of the nation. We firmly believe that the language changes that we have recommended as amendments to Senate Bill 1304 will serve to achieve both of these objectives.

Dear Senator Graham and Committee Members:

Please enter this letter into the Record of your Committee's Hearings on the Clean Water Act.

The Marin Conservation League representing 4,500 members locally has long been interested in wetlands. It is essential that our nation strengthen its wetlands laws. We urge your strong support for wetlands. We also urge support of Senator Boxer's wetlands bill, SB 1195.

Sincerely,

Karin Urquhart

Dear Senator Baucus,

October 14, 1993

On behalf of the Montana Audubon Council, we submit the following comments on the S. 1304. Please include these comments, as well as the enclosed report entitled Protecting Montana's Wetlands: An Overview of Montana's Section 404 Program, as part of the official hearing record for S. 1304.

The Montana Audubon Council is the unified voice of the nine Chapters of the National Audubon Society in Montana. Our membership currently stands at approximately 2,300. You may receive comments on this legislation from others in the Society.

First, there are some positive aspects to S. 1304 which should be recognized. The good aspects of this legislation are as follows:

1. The bill provides for a landowner assistance program, which would assist small landowners with the delineation of wetlands on their property and also furnish them with technical assistance in order to prepare wetlands management plans.
2. The bill creates an appeals process for permitting decisions under Section 404. This would allow the landowner or any person who participated in the public comment process to appeal permitting decisions without having to resort to the judicial system as the only means of appealing decisions.
3. The bill requires the Corps to monitor the issuance of General Permits. Currently, the Corps cannot adequately track general permitting decisions because general permits are generic authorizations that are issued only with minimal environmental review. The Corps needs a monitoring program to determine the real impact that general permits have on wetland habitat. A review would occur every two years, and would include estimates of acreages of wetlands impacted.

As far as the negative aspects of the bill are concerned, the Montana Audubon Council has numerous concerns. Below we detail our concerns on a number of issues, including some issues that are not clear because of vague drafting language. The negative aspects of this legislation are as follows:

1. In the past, the Corps has not regulated activities such as draining, channelization or excavation, even though these activities could harm wetlands. The Corps recently completed a rulemaking process that expanded the scope of regulation under Section 404 to include these activities. Even so, the Corps only regulates those activities to the extent that they actually result in a "filling" of wetlands. This interpretation still leaves a loophole for the "pure" drainage, flooding, etc. of wetlands or other activities which does not involve the physical placement of fill in wetlands.

Although S. 1304 claims to expand the scope of wetlands regulation to draining, mechanized land clearing, ditching, channelization, or other excavation, it only does so as it relates to the "addition or redeposit of dredged or fill material," thus preserving the limited scope of jurisdiction recognized by the Corps in its recent rulemaking (and leaving the loophole for "pure" drainage, flooding, etc.).

In comparison, S. 1195, introduced by Senator Boxer, focuses on the following activities: draining, excavation, channelization, flooding, clearing of vegetation, driving of pilings or placement of other obstructions, diversion of water, or other activities "which impair the flow, reach, or circulation of surface water, or which result in a more than minimal change in the hydrologic regime, bottom contour, or configuration of such waters, or in the type, distribution, or diversity of vegetation, fish, wildlife that depend on such waters."

In other words, S. 1304 focuses on the activity and the "addition or redeposit of dredged or fill material," while S. 1195 focuses on the impacts to water and water quality. The approach taken in S. 1195 is a much more logical approach for the Clean Water Act.

2. Current Corps regulations require that before development in a wetland is approved: 1) it must first be shown that there is no practicable alternative site for the project ("avoidance"); 2) any wetland impacts must be minimized if there is no alternative site ("minimization"); and 3) all wetland impacts that have been identified and minimized must be mitigated ("mitigation"). This three step process is known as "sequencing," and is based on a policy of preserving natural wetlands as a priority.

S. 1304 sets up a regulatory framework that will undermine the use of sequencing for the protection of wetlands. Basically, the bill implements the use of watershed management plans (i.e., watershed-wide planning) to obtain the goal of "no net loss." Part of the watershed management plan approach includes the use of restored wetlands through mitigation "banks," where the preservation or

restoration of an existing wetland may be used as mitigation for the loss of an existing natural wetland.

Since the only overall goal of watershed management plans is "no net loss," and restored wetlands may be used to mitigate losses of natural wetlands to achieve this goal, the overriding policy behind sequencing (i.e., the protection and preservation of natural wetlands as a priority), is lost. Under S. 1304, individual wetlands could be destroyed as long as there is an overall "no net loss" in a region, which may be satisfied as long as there is a plan for restored wetlands.

The Montana Audubon Council opposes this undermining of the use of sequencing for the protection of wetlands. In 1992 the National Academy of Sciences stated that, "It has not been shown that restored wetlands maintain regional biodiversity and recreate functional ecosystems..." (from, *Restoration of Aquatic Ecosystems*, National Academy Press, 1992). Because restoration of wetlands is, at best, uncertain; it is not appropriate to rely on mitigation - avoidance and minimization should always be the preferred alternative for any project.

If watershed management plans are to be used, sequencing needs to remain in tack: avoid, minimize and then (as a last resort!) mitigate.

The Boxer bill, S. 1195, maintains the current law which emphasizes preservation over mitigation, and recognizes that wetland restoration is yet an uncertain science with uncertain benefits. This bill codifies into law the current requirements relating to "avoidance," and maintains the current goal that all wetlands be accorded full protection, including appropriate and practicable mitigation. We support this approach.

3. Current law does not allow for the use of "mitigation banks." S. 1304 relies heavily on the use of mitigation banks and the restoration of existing wetlands to encourage the further destruction of natural wetlands. As noted by the National Academy of Sciences, "Wetlands restoration should not be used to mitigate avoidable destruction of other wetlands..." S. 1304 actually provides for taxpayer subsidies of wetlands destruction, by providing federal funds to private developers to set up mitigation banks. Similarly, the concept of mitigation banking appears to contain another taxpayer subsidy of wetlands destruction through allowing the use of government-funded restoration programs to serve as mitigation for private activities that destroy wetlands.

S. 1195, in contrast, does not allow for mitigation banks; it creates a pilot program for wetlands restoration to evaluate the long-term success of restoration efforts. Based on current knowledge and technology, this approach makes sense.

4. Recently, the Corps amended its rules to provide that wetlands converted to agriculture prior to 1985 are no longer wetlands. S. 1304 makes this the law, but seems to extend this exemption to all prior converted wetlands (i.e., not just before

Montana Audubon Council, Page 4

1985). Thus, with a stroke of the pen, at least 53 million acres of wetlands are no longer considered to be worthy of protection. Yet many of these wetlands, even though stripped of their natural vegetation, still serve important wetland functions. These lands can now be converted to other uses in addition to agriculture, such as shopping centers, subdivisions and other development.

The Montana Audubon Council feels that an appropriate balance needs to be struck in regards to prior converted wetlands. Please keep existing exemptions from regulation for farmers, but only for ongoing farming operations.

Thank you for the opportunity to comment on S. 1304. We are concerned about the protection of wetlands in Montana. At a current approval rating of 99.5% of Section 404 permits in our state. The current law needs to be strengthened to better protect these valuable, fragile, rare areas.

Sincerely,

Janet H. Ellis

Protecting Montana's Wetlands: An Overview of Montana's Section 404 Program

A Report by the Montana Audubon Council, October 1993

Executive Summary

Protection and enhancement of Montana's remaining wetlands is a priority issue for the Montana Audubon Council. Because of this commitment, we have researched and compiled the following report on Montana's 404 program, a critical program for wetlands protection.

This 32-page report looks at how wetlands are protected in our state under Section 404 of the Clean Water Act. It outlines why wetlands are important, Montana's wetland resources, the 404 program, and how the 404 program is working in Montana. The study covers the time period from January 1, 1989 to August 31, 1993.

For most of our country's first 200 years, "wetlands" were generally viewed with contempt. As a result, we waged a war to destroy these wet, tangled places. Now, as we have begun to understand the importance of wetlands, we have developed programs to protect these precious places.

Montana has lost approximately 27% of its original wetlands. Wetlands are rare in this state, making up less than 2% of Montana. They are also precious - for wildlife, flood control, and maintaining our high water quality.

The 404 Program

Section 404 of the Clean Water Act regulates the filling of wetlands. Under the Section 404 program, it is unlawful to fill wetlands without first receiving authorization (known as a "404 permit") from the U.S. Army Corps of Engineers (Corps).

There are three types of permits issued under the 404 program: individual, nationwide and general permits. The biggest projects regulated by the Corps are done through the issuance of individual 404 permits. Individual permits are the only 404 permits with any public involvement. The Corps also can authorize "nationwide" or "general" permits. These permits are granted for projects that the Corps believes will have minimal adverse effects on the environment. They are issued either on a nationwide basis ("nationwide permit") or on a regional or statewide basis ("general permit").

An Overview of Montana's 404 Permits

During the study, the Corps was involved with 1,756 permits, including: 1,333 (75.9%) nationwide permits; 240 (13.7%) individual permits; and 183 (10.4%) general permits.

Based on our review of individual files, only 9 of the 1,756 projects did not get approval by the Corps, for an overall approval rating of 99.5%. The report reviews the reasons that permits were denied and/or withdrawn.

Nationwide Permits

Currently, there are 36 authorized nationwide permits, 21 of which have been used in Montana since January 1, 1991.

Consistently, the most commonly used nationwide permit in Montana is # 26, relating to the filling of headwaters and isolated waters. During the review period, Nationwide Permit # 26 accounted for over one-quarter (25.3%) of all nationwide permit activity occurring in Montana. It allows the filling of up to 10 acres of: isolated wetlands, the headwaters of streams (under 5 cubic feet per second, average annual flow), and lakes.

The report details the problems with Nationwide Permit #26 in an arid state like Montana. We reviewed 132 of the 246 (54.0%) Nationwide Permit #26 files during the study period. Of those, only 36 files included any information on acreage. The total acreage of wetlands lost as reflected in these 36 files was approximately 18.5 acres.

General Permit

Currently there are 10 authorized general permits in Montana. The general permits that have been authorized cover such activities as boat ramp facilities, electric transmission lines, and water intake facilities.

Conclusions

The Montana Audubon Council's research demonstrates that 99.5% of all 404 applications are approved. Contrary to much of the rhetoric heard in discussions surrounding the Section 404 program, it does not significantly stop wetland filling activities in Montana.

A detailed look at the reasons why these permits were denied, showed that there was good cause for each denial. Additionally, the Corps has, whenever possible, worked with applicants to modify projects that face denial. These modifications appear to have improved the effectiveness of projects and reduced the damage done to aquatic ecosystems.

The most alarming part of our research surrounded the loss of wetlands under Nationwide Permit #26. Through the use of that permit, valuable Montana wetlands are being "nicked and dimed" out of existence. Under Nationwide Permit # 26, it is assumed that: 1) isolated wetlands under 1 acre in size (70% of a football field) are of no value; and 2) isolated wetlands under ten acres in size (7 football fields) are of limited value. In an arid state like Montana, these assumptions do not hold true for our small isolated wetland complexes, complexes that are often seasonal in nature.

Given the precious nature of wetlands - a resource that supports a staggering number of Montana's plants and animals, a resource that plays a critical role in flood protection, controlling water pollution, and protecting water quality - our research indicates that wetlands need more protection, not less.

For more information contact Janet Ellis, Program Director, at the Montana Audubon Council office.

Introduction

A great blue heron stands motionless, staring into the water. A painted turtle suns itself on the bank. A green-winged teal tips itself forward and submerges its head, looking for protein-rich insects. The wetland is alive and well.

For most of our country's first 200 years, "wetlands" were generally viewed with contempt. They were thought of as a threat to public health and a waste of productive space. As a result, we waged a war to destroy these wet, tangled places. Now, after 200 years of destruction, we have lost over half of all the wetlands in the lower 48 states. Montana is fortunate to still have approximately 73% of its original wetlands, occupying less than 2% of the state.

As wetlands disappeared, we began to recognize their value. Today many people believe that we cannot afford to lose any more of these precious places. Why? The answer is simple: wetlands are an important part of our natural environment that provide significant benefits to the public.

We first heard the battle cry for "no net loss" of wetlands four years ago. At that time, those words were believed to usher in a new era of wetlands appreciation. What we have found, however, is that these three words mean different things to different people.

Recently a group called the National Wetlands Coalition began a strong push for serious reform in the way that wetlands are regulated and protected. Contrary to what their name might indicate, this group is made up of organizations that want to develop - not protect - wetlands. Its membership includes multinational oil and gas interests, timber companies, real estate developers, agricultural interests, and others bent on developing wetlands. They claim that wetland regulations under Section 404 of the Clean Water Act place an unnecessary burden on the economy of our nation, and that these regulations need to be weakened. Legislation has been introduced in Congress to achieve their goals.

In Montana, the Montana Farm Bureau is one group that has joined the push to weaken Section 404 - at the same time admitting that the issue of wetlands regulation did "not affect Montana landowners as much as it affects other parts of the country...." (See *Wetlands — How Will They Affect Private Property Rights?*, Montana Farmer-Stockman, August, 1991).

Facing this declaration of war on wetlands regulations, the Montana Audubon Council decided to look at the facts surrounding Montana's 404 program; the rhetoric associated with the efforts to weaken the Section 404 program did not seem to be supported by any facts. The question we set out to answer was: how much of a regulatory burden is the Section 404 program in Montana?

After months of pouring over files and analyzing databases, we have decided to publish the results of our research. In this report we have outlined why wetlands are important, what kinds of wetland resources Montana has, a general description of the 404 program, and details on how the 404 Program is working in Montana. It is our hope that discussions in Montana about wetland regulations will now look at the facts - and not fictional rhetoric.

This study does not occur in a vacuum. Several pieces of legislation have been introduced in Congress relating to reform of Section 404. The bigger issue of reauthorization of the entire Clean Water Act will also be taken up in this session of Congress. The Montana Audubon Council will work

Montana is fortunate to still have approximately 73% of its original wetlands, occupying less than 2% of the state.

to ensure that the proposed changes to Section 404, and the Clean Water Act as a whole, correct problems in the current law, while maintaining adequate protection to preserve and enhance existing wetlands. The Council will also continue working to identify and clarify exactly what has and has not been problematic in Montana with the current law.

Why Are Wetlands Important?

Wetlands provide a major part of the habitat required to support a staggering number of creatures.

Perhaps the best known reason for wetlands protection is the importance of these areas as critical habitat. From pintails, great blue herons and tiger salamanders, to beaver, cattails and bog orchids, wetlands provide a major part of the habitat required to support a staggering number of creatures. The biological diversity supported by these precious areas in the arid West is beyond debate: wetlands provide some of the most productive wildlife habitat in our state.

Birds especially need wetlands. In Montana more than 50% of our bird species depend upon or frequent wetlands. For such waterfowl, wading birds, shorebirds, songbirds and others, wetlands provide important habitat for breeding, nesting, migration and wintering. Temporary wetlands, those areas that have water for only a short time in the spring, are critical for migrating birds; they provide birds with much needed food and resting areas on their long journey to nesting sites in the north. In addition, wetlands are also vital to all freshwater fish throughout their existence, for spawning, feeding or predator avoidance.

This bounty of species supported by wetlands provides another benefit in the form of outdoor recreation opportunities: according to the U.S. Fish & Wildlife Service, in 1985 over 141 million Americans participated in wildlife-associated recreation, spending 55 billion dollars. Those figures are growing each year. The majority of these activities depended upon the existence of productive wetlands.

In addition to providing important habitat, wetlands also provide other significant public values. They play a critical role in flood protection, controlling water pollutants, and maintaining water quality. At a time when the government and private sector are spending billions each year to address these problems, it seems "a pound foolish" to eliminate the natural features which provide these same services at practically no cost.

Wetlands act like a big sponge. During storms they collect and hold water, releasing it slowly over time. This action lowers flood peaks, slows water velocities, provides temporary water storage, and acts as a water filter for pollutants and nutrients. As suspended particles move through a wetland, they are held in the vegetation and soil. Toxic substances, including heavy metals, toxic chemicals and pathogens, are filtered out. Captured nutrients, including phosphorous and nitrates, are slowly returned to the water or are used by plants, thus stabilizing nutrient loads. The filtering ability of wetlands helps maintain - or even improve - water quality, including groundwater.

When adjacent to lakes and rivers, wetland vegetation can be invaluable for shoreline stabilization. Riparian vegetation absorbs and dissipates wave energy and captures sediments that are suspended in the water, reducing the amount of soil erosion from banks.

Wetlands play a critical role in flood protection, controlling water pollutants, and maintaining water quality.

Montana's Wetland Resources

Wetlands in Montana, while small in number and acreage, are critical areas for irrigators, homeowners, recreationists and scientists, as well as for wildlife and aquatic plant communities. Less than 2% of our state is occupied by wetlands.

It is worth noting that Montana, in comparison to other states, can apparently consider itself fortunate to still have approximately 73% of its original wetlands intact. When considered relative to the losses of our neighbors, however (South Dakota, 35% lost; North Dakota, 50% lost; Wyoming, 38% lost; Idaho, 56% lost, and; Minnesota, 43% lost), it is obvious that Montana's remaining wetland resources are extremely valuable and must be protected. The value of wetland resources in the otherwise arid West, where well over 50% of all wetlands have been lost (among all western states), cannot be overstated.

A glimpse of the remaining wetland resources in Montana is found in the *Regional Wetlands Concept Plan for the Mountain-Prairie Region*, published by the U.S. Fish and Wildlife Service, dated July, 1990 (*Plan*). According to the *Plan*, Montana contains a wealth of what are identified as "high priority" wetlands. These critical areas are defined as "rare, declining, and threatened wetlands providing a multiple array of benefits such as production and migration habitat for nongame migratory birds, as well as waterfowl; floodwater protection; environmental education and research; water purification; bird watching, fishing, hunting, and other recreation; open space in urban settings; and habitat for furbearers and resident game species."

Our priority wetlands include the prairie potholes in northeast Montana, subalpine meadows in the mountainous part of the state, small intermountain glaciated wetland complexes, western riparian wetlands, and isolated closed basins in central and south-central Montana. Of these types of wetlands, two (prairie potholes and western riparian wetlands) are among the nine identified wetland habitats nationwide of particular critical concern. In the *Plan*, losses of these two types of wetlands are described by the U.S. Fish & Wildlife Service as "severe."

Prairie Potholes

The prairie potholes in the northeast corner of the state are productive in every sense of the word. These wetlands vary in size from less than one acre to several hundred acres. Most of them are less than two feet deep and dry much of the year.

The "prairie pothole region" is widely recognized as the most significant "duck factory" in the lower 48 states. Common nesting species of waterfowl include mallard, northern pintail, gadwall, blue-winged teal, shoveler, redhead, canvasback, scaup and Canada goose. The typical wetland complex associated with prairie potholes provides optimum habitat for waterfowl reproduction and growth. Each part of the complex serves a distinct phase in the bird's nesting, breeding, and brood-rearing cycles.

These areas are also critical "resting" habitat for other waterfowl and shorebirds as they replenish protein and energy reserves to sustain them through migration and nesting. For this reason, seasonal and temporary wetlands in this region are invaluable to millions of arctic and subarctic nesting birds that pass through each spring.

Montana's prairie potholes and western riparian wetlands are among the nine identified wetland habitats nationwide of critical concern.

Over 225 species of birds are confirmed nesters in the prairie pothole region.

Over 225 species of birds are confirmed nesters in the prairie pothole region, many of which occur in Montana. This list includes nesting pairs of the threatened piping plover, endangered least tern, and the endangered bald eagle. These wetlands are also of critical importance to several endangered species during migration, including the whooping crane and peregrine falcon.

Wetland habitats in the prairie pothole region are also vital to many prairie mammals, which rely upon such habitats for both cover and a substantial portion of their food. Additionally, various Montana amphibians and reptiles also depend upon the prairie potholes, including the tiger salamander, rocky mountain toad, chorus frog, painted turtle and plains garter snake.

Finally, prairie pothole wetlands are the focal point in the hydrologic regime of the prairies. These wetlands store runoff water and serve as floodwater storage reservoirs by allowing water to "evapotranspire" to the atmosphere or slowly seep into the groundwater. While leaving prairie pothole watersheds intact will not necessarily prevent flooding in lower parts of a watershed, artificially draining these watersheds will make flooding problems worse. Prairie pothole complexes also play an important role in groundwater recharge or flowthrough, nutrient trapping, water quality, and the prevention of soil salination.

Western Riparian Wetlands

The western side of Montana also possesses many valuable wetland resources. In particular, the *Plan* describes western riparian wetlands as significant in terms of "resource values," and notes that in Colorado and Wyoming, about 90% of all wildlife species depend upon such riparian habitats, which account for less than 2% of the total land space in those states. It is likely that a similar conclusion can be drawn for Montana, which has essentially the same ratio of riparian habitat to land space.

Western riparian wetlands provide critical nesting and wintering habitat for bald eagles, as well as important seasonal or year-round habitat for a wide range of other resident wildlife, including deer, songbirds, upland game birds, small mammals, elk, moose and bear.

Western riparian wetlands also perform many important hydrologic functions such as ground-water storage and recharge of adjacent river systems and streams. These activities help to replenish connected aquifers, which provide water for irrigation, and supply late season instream flows which are important for water quality and fisheries. They also provide some degree of flood control and serve to reduce floodplain erosion.

Other wetlands in western Montana are also significant. For example, the small, intermountain glaciated wetlands in the Flathead Valley support the highest published density of nesting redhead ducks in North America. This fact becomes even more noteworthy when one considers that the U.S. Fish & Wildlife Service has reported that the 1991 redhead population was 6% lower than in 1990, and 26% below the 35-year average. As with prairie potholes, intermountain glaciated wetlands provide important habitat for a diverse number of species, including peregrine falcons, and provide critical wintering, nesting and migration habitat for bald eagles.

Many rare plant species in Montana are wetland-dependent. For example, Howell's gumweed (*Grindellia howellii*) occurs largely in the glacial potholes and old river oxbows of the Swan Valley. Other rare plant species dependent upon or associated with wetlands in the state include the yellow springbeauty (*Claytonia lanceolata* var. *flava*) and the sepal yellowcress (*Rorippa calycina*).

Finally, montane palustrine wetlands of the mountains of western Montana are identified for their important functional values in serving as "seeps" and "sediment traps." Both of these functions work to protect existing fish populations.

The small, intermountain glaciated wetlands in the Flathead Valley support the highest published density of nesting redhead ducks in North America.

The 404 Program: How it Works

An important role of Section 404 of the Clean Water Act is to regulate the filling of wetlands. In order to understand how well our wetlands are protected, it is important to understand which wetlands are protected under Section 404.

The Clean Water Act calls for restoring and maintaining the chemical, physical, and biological integrity of the nation's waters. While retaining and strengthening existing water quality standards, the Clean Water Act also limits activities in "waters of the United States," including wetlands.

Section 404

Basically, Section 404 of the Clean Water Act helps protect wetlands by regulating the "discharge of dredged or fill material" into "waters of the United States." "Water of the United States" include all streams to their headwaters (5 cubic feet per second, average annual water flow); lakes over 10 acres; some isolated wetlands; and wetlands adjacent to waters of the United States. The "discharge of dredged or fill material" involves the physical placement of soil, sand, gravel, dredged material or other such material into waters of the United States.

Under the Act, it is unlawful to discharge dredged or fill materials into waters of the United States without first receiving authorization (known as a "404 permit") from the U.S. Army Corps of Engineers (Corps). Although the idea sounds simple enough, there are several important exceptions to the law that allow for the filling of wetlands.

Exemptions from 404

Not all activities in wetlands or waterways are subject to the Section 404 program. Congress has specifically exempted some activities from regulation, including normal farming, forestry, and ranching activities. To fall under these exemptions, the activities must be part of an on-going farming, ranching or forestry operation - and not associated with bringing a wetland into agricultural production or converting an agricultural wetland to a non-wetland area. Several years of disking, planting and draining can effectively dewater a wetland. Developers have used the "agricultural exemption" as a cover for converting wetlands for development.

Recently, the Corps determined that mechanized land clearing, ditching, channelization and excavation require a Section 404 permit. However, there are still several development activities that cause direct wetland damage that are not regulated under Section 404. These activities include the drainage of wetlands without excavation; lowering of groundwater levels; flooding of wetlands; and activities on upland areas that affect wetlands through soil erosion, pollution, or diversion of water.

404 Permits

There are three types of permits issued under the 404 program: **individual**, **nationwide** and **general** permits.

The application for a permit is two pages. The application requests information on the description, location, and purpose of the proposed project; the amount of fill or dredged material to be used in the project; a list of adjoining property owners; and a list of any other permits needed for

It is unlawful to discharge dredged or fill materials into waters of the United States without first receiving authorization (known as a "404 permit") from the U.S. Army Corps of Engineers.

There are three types of permits issued under the 404 program: individual, nationwide and general permits.

the project, including whether other permits have been approved or denied. Drawings of the described project may also be required.

Normally it takes two to three months for the Corps to process a routine individual permit. Less time is required to process applications for routine general and nationwide permits. It may take a longer time to process the application for larger and more complex projects.

Individual Permits

The biggest projects regulated by the Corps are done through the issuance of individual 404 permits. Individual 404 permits require that a public notice be issued on the project. The public notice contains information about the location of the project, the amount of fill to be placed, the amount of excavation proposed, and the purpose of the project. The public has 15 - 30 days to comment on a public notice. The notice is also reviewed by local, state and federal agencies at this time. If the project is large and controversial enough, a public hearing may be held on the project.

After the public comment period is over, the Corps examines the comments that have been submitted, and evaluates the impacts of the project. Based on the comments received, the Corps can work with the applicant to modify the project. Modifications are usually done to improve the effectiveness of the project and/or reduce the environmental impact of the project. After its evaluation, the Corps will then either approve or deny the application.

You may request that you or your organization be put on the mailing list to receive public notices of permit applications on the Missouri River, Yellowstone River, or throughout Montana. To do this contact the Army Corps of Engineers, 1520 East Sixth Ave., Helena, MT 59620-2301 (444-6670).

Nationwide and General Permits

The Corps also can authorize "nationwide" and "general" permits. These permits are granted for projects that the Corps believes will have minimal adverse effects on the environment. They are issued either on a nationwide basis ("nationwide permit") or on a regional or state-wide basis ("general permit"). An individual permit is usually not required of projects that fit the criteria of a nationwide or general permit.

Currently, there are 36 authorized nationwide permits, 21 of which have been used in Montana since 1991 (See Appendix III for the nationwide permits used in Montana). Nationwide permits cover such activities as small bank stabilization projects, the maintenance of previously authorized structures, and small hydropower projects. Probably the most controversial is Nationwide Permit # 26, which authorizes discharge of dredged or fill material in up to 10 acres of: isolated wetlands, the headwaters of streams (under 5 cubic feet per second, average annual flow), and lakes. Nationwide Permit # 26 thus exempts a wide variety of riparian areas, ponds and springs from permit scrutiny.

Currently there are 10 authorized general permits in Montana (See Appendix IV for the general permits used in Montana). The general permits that have been authorized cover such activities as boat ramp facilities, electric transmission lines, and water intake facilities.

Projects qualifying for a nationwide or general permit have no public notification or review process. State and federal agencies do, however, review some of these permit applications. A general or nationwide permit may be challenged, but only on the grounds that the project has "more than minimal adverse environmental effects, individually or cumulatively, or would be contrary to the public interest." In such cases, the Corps may use its discretionary authority to require an individual permit for these projects.

Nationwide and general permits, and their use in Montana, are discussed in more detail below.

Currently, there are 36 authorized nationwide permits, 21 of which have been used in Montana since 1991.

Currently there are 10 authorized general permits in Montana.

After-the-Fact Permits

The Corps may require an after-the-fact permit from anyone who has filled a wetland without a permit. The Corps may allow the fill to remain, with conditions, or may order the fill removed if the project does not meet the requirements for a permit. After-the-fact permits provide an opportunity to rectify unauthorized and/or damaging activities.

Approval Requirements

All 404 permits must follow certain minimum requirements before they can be approved. Among these requirements, projects must be "water dependent", meet certain public interest criteria, follow Environmental Protection Agency guidelines, and follow state water quality standards. Additionally, if the project can be completed by using a practical alternative that would have a less damaging impact on the aquatic ecosystem, then the less damaging alternative must be considered and, whenever possible, followed by the applicant.

Only projects that are "water dependent" can be approved under Section 404. The purpose of this requirement is to prevent the filling of a wetland if there is an upland site that the same project can be completed on. If the wetland does not have to be filled to accomplish the same result, the project cannot be approved. For example, a restaurant does not need to be placed in a wetland to fulfill its basic purpose of feeding people.

The public interest criteria considered by the Corps include conservation, economics, aesthetics, environmental quality, historic values, fish and wildlife values, flood damage prevention, land use, food production, recreation, water supply, energy needs, safety, and the needs and welfare of the public.

The Role of Government Agencies

The Section 404 permit program is jointly administered by the Corps and the U.S. Environmental Protection Agency (EPA). The Corps is responsible for processing permit applications, issuing or denying permits, and taking enforcement actions against permit violators.

The EPA has the authority to set the environmental standards with which the Corps must comply when issuing permits. It also shares enforcement authority with the Corps and is the final authority in regard to wetlands delineation (what is - and what is not - a wetland). Importantly, the Environmental Protection Agency also has veto power over a permit issued by the Corps, if it will have an unacceptable adverse impact on municipal water supplies, shellfish beds, fishery areas, wildlife, and recreational areas. Since the Clean Water Act was passed in 1974, the EPA has used this veto power on less than two dozen occasions in the United States, out of more than 150,000 permit applications filed under Section 404. There have been no EPA vetos in Montana.

State natural resource agencies also play an important role in reviewing and approving Section 404 permits that are considered by the Corps. Under Section 401 of the Clean Water Act, the state has the right to deny a proposed project if the project will impair Montana's water quality.

The Section 404 permit program is jointly administered by the Army Corps of Engineers and the U.S. Environmental Protection Agency. State natural resource agencies also play an important role in reviewing 404 permits.

An Overview of 404 Permits in Montana

This overview of Section 404 permit activity in Montana relates to all activities conducted during the review period that meet two criteria: first, the activity is conducted in Montana under Section 404, and; second, the activity was reported or otherwise tracked, authorized or permitted by the Corps. As noted below under the discussion relating to nationwide permits, the Corps is not required to receive notification for all activities conducted in wetlands.

During the period from January 1, 1989 to August 31, 1993, the Corps was involved with 1,756 permit applications. The following is a breakdown of the types of permits:

Nationwide Permits	1,333	75.9%
Individual Permits (or Amendments)	240	13.7%
General Permits	<u>183</u>	10.4%

Total Activity 1,756

Based on our review of individual files, 99.5% of all 404 applications were approved by the Corps - only 9 of the 1,756 projects did not get approval. Keeping this in mind, the "regulatory burden index" associated with the Section 404 program in our state is minimal. Clearly, the operation of the Section 404 program in Montana is not stopping proposed activities from occurring in jurisdictional wetlands.

Of the 1,756 applications processed during our study, 5 applications were denied and 24 applications were withdrawn. We examined these files individually to determine the reasons that these permits were denied or withdrawn.

A denied application did not always mean that a project could not proceed. Two of the five denied applications were subsequently authorized by the Corps under another type of permit: one of the denials was eventually authorized under a nationwide permit, and one was granted an individual Section 404 permit.

Of the 24 applications that were withdrawn, six may be characterized as withdrawn "in the face of likely denial by the Corps." Six of the remaining 18 applications that were withdrawn were subsequently authorized by the Corps under another type of permit: four of the withdrawals were eventually authorized under nationwide permits, one was later authorized under a general permit, and one was later permitted under Section 10 of the Rivers and Harbors Act. The remaining twelve applications that were withdrawn were the result of voluntarily action by the applicant, taken for a number of reasons, largely unrelated to the Section 404 regulatory program.

The reasons behind denial by the Corps and withdrawal by the applicant are varied, and are reviewed in greater detail in the following sections.

During the period from January 1, 1989 to August 31, 1993, the Corps was involved in 1,756 permit applications in Montana. Of those permits, 99.5% were approved by the Corps - only 9 of the 1,756 projects did not get approval.

404 Permits Denied in Montana

During the relevant time period of this study (56 months), there were only five Section 404 permit applications "denied" in Montana by the Army Corps of Engineers.

During the relevant time period (56 months), there were only five Section 404 permit applications that were "denied" by the Corps. Our review looked at all five of these files (Foss, Baugus, Burlington Northern, Valley Ditch, and Hathaway Ranch). Details on each of these applications can be found in Appendix I.

Three of the five applications were denied because the State of Montana did not certify the project under Section 401, meaning that the State believed the proposed project would result in a violation of Montana water quality standards (Foss, Baugus, Burlington Northern). Initially, the two remaining applications were also denied for lack of Section 401 certification, but State certification was later granted. As a result, Valley Ditch received an individual section 404 permit, and the Hathaway Ranch application was later authorized under Nationwide Permit # 13.

Although in each denied application the action of the State refusing Section 401 certification is the reason provided to the applicant for the denial, four of these projects were controversial in their own particulars, and in at least three of these projects there was clearly other grounds that may have served as a basis for denial. A short description follows:

In the Baugus application, the applicant sought to riprap property that he did not own on the Yellowstone River. The applicant had already received authorization from the Corps for a previous project and apparently had not completed that work in a satisfactory fashion. In addition, the applicant did not have the required 310 permit from the local conservation district.

In the Burlington Northern application, the applicant sought to construct a new railroad bridge on Stanton Creek, adjacent to the Flathead River. In addition to the water quality concerns of the Montana Department of Health & Environmental Sciences; the Montana Department of Fish, Wildlife & Parks expressed concerns regarding impacts upon migrating westslope cutthroat and bull trout; and the Montana Department of Highways was concerned that the proposed project would disrupt existing runoff and drainage patterns associated with the existing road. Both the Montana Department of Health & Environmental Sciences and the Montana Department of Fish, Wildlife & Parks asserted that an acceptable alternative was available to accomplish the project.

In the Foss application, the applicant proposed to use tires as riprap along the Missouri River. Concerns were expressed by the Environmental Protection Agency, U.S. Fish & Wildlife Service, and the Corps over the desirability and prospects for success of this proposal.

In the Valley Ditch application, the applicant sought a permit to perform required restoration work stemming from illegal fill activities on the Gallatin River. The applicant, without authorization, bulldozed a channel across the river, and was taken to court by both the local conservation district and the Montana Department of Health & Environmental Sciences. After the initial denial of Section 401 certification by the Montana Department of Health & Environmental Sciences, the restoration project was subsequently amended and approved.

In the Hathaway application, the applicant proposed to use concrete slabs on a river bank to prevent erosion. The Montana Department of Health & Environmental Sciences objected, noting that the proposed project involved placing a pollutant in a position where it was likely to pollute state

waters, and that the density of concrete was inadequate to sufficiently protect the streambank. Ultimately, the Montana Department of Health & Environmental Sciences granted Section 401 certification on a demonstration basis only, after requiring the applicant to permanently anchor pre-cast concrete slabs, and conduct monitoring and reporting.

404 Permits Withdrawn in Montana

During the study period, a total of 24 filed applications were subsequently withdrawn for various reasons. Of these applications, we were able to look at 23 of the files. The remaining file, relating to the application of Cops Construction, could not be located. Details on each of these applications can be found in Appendix II.

Withdrawal in the Face of Likely Denial

Although the process of withdrawing an application is a voluntary one undertaken by the applicant, in six of the cases the voluntary withdrawal was made by the applicant in the face of possible - or even likely - denial by the Corps [Griffel (2 applications), Auto Auction, Whitmer, Land & Lake Recreation, and Clothier].

In four of these files, the Montana Department of Health & Environmental Sciences had denied certification under Section 401, because it was anticipated that the proposed project would violate Montana water quality standards [Griffel (2 applications), Auto Auction, Whitmer]. In all four cases other grounds appeared to exist for denial by the Corps.

In the two Griffel applications, the projects involved placing rock jetties in the Yellowstone. The applicant had received a 310 permit from the Stillwater Conservation District for blanket riprap as opposed to rock jetties. Comments opposing the application because of the use of rock jetties were filed by the Montana Department of Fish, Wildlife & Parks; Environmental Protection Agency; and the U.S. Fish & Wildlife Service.

In the Auto Auction application, the applicant proposed to fill a slough adjacent to the Yellowstone River to provide space for parking. The previous owner of the property had filled adjacent wetlands under a previous Corps permit, but had not performed the required mitigation activities. In addition, both the Environmental Protection Agency and the U.S. Fish & Wildlife Service objected to the project as not water dependent.

In the Whitmer application, the applicant proposed to remove sand from an existing irrigation intake structure, and place the excavated material on a sand bar in the river. The U.S. Fish & Wildlife Service expressed concerns over nesting activities of the endangered least tern and threatened piping plover. The Environmental Protection Agency also expressed concerns in regard to the placement of excavated material on a sandbar within the high water mark, and noted that this was not a practical alternative for the discharge of dredged material. When the applicant did not respond to inquiries from the Corps regarding the status of the application, the application was deemed withdrawn.

In the application of Land & Lake Recreation, Inc., the applicant proposed to place fill on land they did not own at Noxon Reservoir. The Washington Water Power Company objected because the project would take place on company property and was not a long term solution to the identified

During the study period, a total of 24 filed applications were withdrawn for various reasons. Only in six cases was a permit withdrawn in the face of possible - or even likely - denial by the Army Corps of Engineers.

In six of the files that were reviewed, the application was withdrawn only to be authorized by the Corps under other permits.

problem. The Montana Department of Health & Environmental Sciences withheld certification under Section 401 until the water quality impacts and other alternatives could be further assessed. The Environmental Protection Agency objected as the applicant had not considered less damaging alternatives. The Montana Department of Fish, Wildlife & Parks objected because the project would cause further bank destabilization and siltation. The Montana State Historic Preservation Office raised concerns about historical sites.

Finally, in the Clothier application, the applicant proposed to use tires as riprap in a backwater of the Flathead River. Concerns were expressed by the Corps over the desirability and prospects for success of this proposal. Clothier was also denied a 310 permit from the Flathead Conservation District, and the project was cancelled.

Withdrawn But Authorized Under Other Permits

In six of the files that were reviewed, the application was withdrawn only to be authorized by the Corps under other permits. One project was subsequently authorized under Section 10 of the Rivers and Harbors Act (Nemitz), one project under a general permit (Junction City Ranch), and four under nationwide permits, including Nationwide Permit # 18 (Fort Peck Marina, Olson), Permit # 13 (Thomas), and Permit # 26 (Heckford).

Other Reasons for Withdrawal

Of the eleven remaining files that were examined: four projects were revised during the review process so that Section 404 permits were not required (City of Great Falls, Fox, Beaudette, Whitefish Lake Golf Course); two projects were withdrawn because of funding (Montana Power Company, Montana Department of Highways), although the Montana Department of Highways project was subsequently revised and authorized; two applications (Stepler, Schellinger Construction) were unable to secure other necessary approvals or agreements, unrelated to water quality concerns, and the projects were cancelled (a real estate easement, and a Forest Service permit, respectively); and three projects, that had faced little or no opposition, were cancelled for undisclosed reasons (Bilden, Urbani & Associates, Victor Land & Livestock).

As mentioned above, only one file, relating to the application of Copps Construction, could not be located. Records indicate, however, that the application was withdrawn on the same day that the Corps received it.

Nationwide Permit Activities

As described above, the Army Corps of Engineers may provide blanket authorization for certain activities in wetlands or waterways that the Corps believes will have minimal adverse effects on the environment. The permits may be issued on a nationwide basis, as nationwide permits, or on a local or regional basis (general permits). Currently, there are 36 authorized nationwide permits, 21 of which have been used in Montana since January 1, 1991. A description of the nationwide permits used in our state can be found in Appendix III.

A dramatic increase in the use of nationwide permits has been seen in recent years: 325 in 1991, 346 in 1992, and 300 (to date) in 1993. These figures are up from the previous high of 202 in 1990, and 156 in 1987.

Nationwide permits apply to a wide range of activities: from bank stabilization projects to small

hydropower. The various nationwide permits contain restrictions, conditions, and in some cases, notification procedures which must be met.

Who Reviews Nationwide Permits

The State of Montana, under Section 401 of the Clean Water Act, can either review or waive review of nationwide permits that may result in a discharge into waters of the United States. Currently, the Montana Department of Health & Environmental Sciences has waived certification on all nationwide permits except Nationwide Permit Numbers 12, 13, 16 and 26.

The Environmental Protection Agency (EPA) is the certifying agency for Indian Lands within the State of Montana. The Environmental Protection Agency has waived Section 401 certification for all nationwide permits except Nationwide Permit Numbers 12, 13, 15, 16, 17, 18, 23, 26, 32, 33, 40, and for any nationwide permit where the proposed activity involves the placement of wood timbers treated with chemical preservatives in a river, stream or adjacent wetland.

Anyone in Montana applying for a nationwide permit that is reviewed by the Montana Department of Health & Environmental Sciences or the Environmental Protection Agency [12, 13, 15, 16, 17, 18, 23, 26, 32, 33, and 40] needs to: 1) comply with all the requirements of the nationwide permit; and 2) obtain Section 401 water quality certification from the Montana Department of Health & Environmental Sciences or the Environmental Protection Agency.

As mentioned above, the Corps retains the discretionary authority to modify, suspend, or revoke nationwide permits for specific projects. If the Corps does this, the project is required to obtain an individual Section 404 permit. This may occur if an activity is determined to have more than minimal adverse environmental impacts (either individually or cumulatively), or would be contrary to the public interest.

During the duration of this study, no nationwide permit was denied by the Department of Health & Environmental Sciences, Environmental Protection Agency, and/or the Corps.

Montana's Nationwide Permit Activities

Less information is readily accessible on nationwide permits, than on individual and general permits. For this reason our research regarding the details of nationwide permits covers the time period from January 1, 1991 to August 31, 1993. During that time, nationwide permits were used in 971 separate occasions in Montana. The annual use of nationwide permits issued in Montana is detailed in Table 1 on Page 14.

Consistently, the most commonly used nationwide permit in Montana is # 26, relating to the filling of headwaters and isolated waters. During the review period, Nationwide Permit # 26 accounted for over one-quarter (25.3%) of all nationwide permit activity occurring in Montana (1991 — 25.5%; 1992 — 25.4%; 1993 — 25.0%).

Other significant areas of activity under the nationwide permit system include #3 (Maintenance), #12 (Utility Line Backfill and Bedding), #13 (Bank Stabilization), and #14 (Road Crossing), which when combined accounted for 57.0% of all nationwide permit activity during the review period (1991 — 63.1%; 1992 — 57.5%; 1993 — 53.0%). Aside from Nationwide Permit # 26, which is discussed further below, the activities conducted under these nationwide permits are self-explanatory (for example, Nationwide Permit # 12 is generally used for activities relating to utility lines). As a general rule, the Corps files contain no information on the size of the wetlands involved in these nationwide projects.

Nationwide Permit Numbers 14 (Road Crossings) and 18 (Minor Discharges) were used for a

During our study, nationwide permits were used in 971 separate occasions in Montana. Consistently, the most commonly used nationwide permit in Montana is # 26.

wide variety of projects. During the review period, there were 131 authorizations under Nationwide Permit # 14. After looking at over half (70 out of 131) of the Nationwide #14 files, approximately 31% involved government road projects, 26% were attributable to residential development, and 20%

Table 1. Nationwide Permits issued in Montana between January 1, 1991 and August 31, 1993.

Nationwide Permit	Year		Totals	%	
	1991	1992 *1993

* 1993 information covers the period between January 1 and August 31.

various governments (26%) and utilities (26%), and the majority of the utility activities involved the assessment of archeological sites. Other activities under Nationwide Permit # 18 included the construction of boat ramps and docks (16%) and various agricultural activities (13%). The remainder were the result of miscellaneous activities. Only one of these thirty-eight files contained any information regarding wetlands acreages: a track realignment by Burlington Northern along Whitefish Lake involved the disturbance of 0.05 acres of wetlands.

related to various agricultural activities. The remainder were the result of miscellaneous activities. Only one of these seventy files contained any information regarding wetlands acreages: an Environmental Assessment completed for a Federal Highway Administration project in the Bitterroot Valley noted that twelve separate wetland areas ranging in size from 0.1 to 3.4 acres would be impacted, for a total acreage of 7.8 acres; other wetlands would also be encroached upon. Some mitigation, by expanding existing wetlands, was anticipated for this project.

During the review period, there were 51 authorizations under Nationwide Permit # 18. After looking at most (38 files out of 51) of these, the majority of activities were conducted by

As a general rule, the Corps files contain no information on the size of the wetlands involved in nationwide projects.

Nationwide Permit Number 26

As described above, Nationwide Permit # 26 is the most commonly used nationwide permit in Montana. It allows the filling of up to 10 acres of: isolated wetlands, the headwaters of streams (under 5 cubic feet per second, average annual flow), and lakes.

In an arid state like Montana, wetlands, headwaters and lakes up to 10 acres in size are a valuable resource - especially when one considers that Montana's wetland resources are principally small in size: prairie potholes, glaciated potholes, montane palustrine wetlands, and the headwaters of all our streams.

To understand Nationwide Permit # 26, you must also understand what 10 acres - and one acre - means. For this reason, we compare these acreages to something found in almost every community in Montana: a football field. According to Webster's New Collegiate Dictionary, a football field is 130 yards by 53-1/3 yards or 6,933 square yards. One acre is 4,840 square yards, or 70% of one football field. Ten acres is 48,400 square yards, or the size of 7 football fields.

Nationwide Permit # 26 authorizes the filling of up to 10 acres, the size of 7 football fields, of isolated wetlands, headwaters or lakes. For this reason, we feel it is important to review in detail the activities completed under this nationwide permit.

For projects that involve the filling of less than 1 acre of wetland (70% of one football field), no notice or approval from the Corps is required. For acreages from 1 to 10 acres a "pre-discharge" notice is required. This pre-discharge notice requires a site check by the Corps, and a quick review of the project by necessary wildlife agencies. There is no public notice for any nationwide permit.

To get a feel for what kind of activity was occurring under this nationwide permit, we examined individual Nationwide Permit # 26 files. We were able to review 132 of the 246 files (54.0%) authorized during the study period. Of the 132 total, only 3 of the projects involved greater than one acre, and thus required "pre-discharge" notice to the Corps. The total acreage for these three projects was 6.24 acres. Since no notice to the Corps is required for projects involving less than one acre, it is anticipated that many projects conducted under Nationwide Permit # 26 are not even reported to the Corps at all, and are thus not reflected in their records.

The majority of Nationwide Permit # 26 activities (approximately 75%) reported to the Corps during our study involved "knowledgeable" participants (railroads, development corporations, consultants, government agencies, or work performed under the supervision of government agencies). Attempting to ascertain the extent of unreported activities under Nationwide Permit # 26 will be the subject of future research efforts. It is almost certain that the scope of unreported activity under Nationwide Permit # 26 is substantial. As an example, only one of the 132 projects that we looked at involved active mining activities; yet it is known that extensive mining activity in riparian and wetlands areas takes place in Montana. [See, for example, *Inventory of Placer Mining Effects on Stream Resources in the Vicinity of the Helena National Forest*, (Montana Department of Fish, Wildlife & Parks, 1987)]. Similarly, it seems intuitive that residential and commercial development should account for more than eleven of these files.

Of the 132 projects examined, 71 of these projects involved agricultural activities. Sixty-four

Nationwide Permit # 26 authorizes the filling of up to 10 acres, the size of 7 football fields, of isolated wetlands, headwaters or lakes.

of these projects involved creating watering areas for livestock, and the majority of these activities were reviewed and approved by the Soil Conservation Service. The Soil Conservation Service requires the Corps to be notified on all of its projects affecting wetlands, regardless of the wetland acreage that is involved in the project. The other 7 agricultural projects under Nationwide Permit # 26 primarily involved activities related to irrigation.

The remaining 61 projects may be further broken down into the following categories, which are largely self-explanatory: residential and commercial development (11); ponds (5); domestic water supply (1); active mining (1); reclamation (7); railroad and/or vehicle road projects (13); dam maintenance or construction (2); unidentified (1); and enhancement (20). As a general observation about the enhancement projects, many of them resulted in a "net gain" of wetlands. However, these enhancement projects also involved "trading" one wetland type for another (usually a pond is substituted for a wet meadow). According to the National Academy of Science, the success of wetland restoration efforts is, at best, uncertain. Given the uncertain success of these efforts, and the "trading" of one wetland type for another, it is difficult to quantify a true "net gain" for these projects.

As a general rule, the files of the Corps contain very little information regarding the activities that are conducted under any of the nationwide permits. The files for Nationwide Permit # 26 are no exception. When combined with the lack of reporting requirements under Nationwide Permit # 26, it is very difficult to generate any actual acreage estimates regarding the amount of wetlands that are being lost.

Of the 132 projects reviewed under Nationwide Permit #26, only 36 files included any information on acreage (including the 3 "pre-discharge" notices). The total acreage of wetlands lost as reflected in these 36 files was approximately 18.5 acres. Although acreage information was provided for only a few of the Soil Conservation Corps (SCS) approved stockwater projects, due to the similarity of these projects, it is possible to extrapolate the acreage lost by projects where no acreage information was provided. In general, the wetlands acreage lost as a result of these projects was estimated to be 0.1 acre per project. Multiplying this by the remaining 58 SCS stockwater projects for which no size information was provided, results in an additional 5.8 acres lost, for a "known" total of 24 acres lost under Nationwide Permit # 26.

Of the 132 individual files we were able to look at for Nationwide Permit # 26, 3 of the projects involved greater than one acre, and thus required "pre-discharge" notice to the Corps. The rest of the permits were under 1 acre in size.

General Permits

In addition to the nationwide permits described above, there are general permits issued in Montana. Some of these permits are issued on a district basis, others on a statewide basis, and still others on a waterway basis (for example, such as for the Missouri or Yellowstone River). Although the Corps records are somewhat unclear as to the total number of outstanding valid general permits, it appears that ten general permits (GP) are currently used in Montana. A description of the general permits used in our state can be found in Appendix IV.

During the time from January 1, 1989 to August 31, 1993, general permits were used in Montana on 182 separate occasions, with the number of authorizations ranging from a high of 54 in 1990, to a low of 29 in 1991 (1989 — 30; 1990 — 54; 1991 — 29; 1992 — 31; 1993 — 38).

Over the review period 78 (43%) of the general permit authorizations were granted pursuant to GP 89-03 (Habitat Improvement), 53 (29%) of the authorizations were under GP 82-10 (Boat Ramps), and 26 (14%) were under GP 90-01 (Water Intake Facilities on Fort Peck Reservoir). The remainder of the authorizations were scattered among GP 76-05 (Riprap) (8 permits), GP 79-03

(Electrical Transmission Lines) (1 permit), GP 87-02 (Fill for Boat Ramps and Docks on Flathead Lake) (2 permits), GP 88-01 (Mitigation Projects) (1 permit), 88-02 (Restoration Projects) (1 permit), 88-03 (Dams for Phase II and Phase III Waterways) (7 permits), and 89-04 (Existing Structures on Corps Lands) (5 permits).

The Montana Audubon Council's review of Corps' records did not include a review of the individual files associated with each general permit authorization.

Conclusion

Contrary to much of the rhetoric heard in discussions surrounding the Section 404 program, an overall approval rating of 99.5% does not support the claim that the program imposes a substantial regulatory burden.

One year ago, the Montana Audubon Council set out to answer the question: how much of a regulatory burden is the Section 404 program in Montana? After months of pouring over files and analyzing databases, the verdict is in - and the answer is a clear "No."

Currently, 99.5% of all 404 permit applications are approved. Contrary to much of the rhetoric, our research demonstrates that Section 404 of the Clean Water Act, as now written and enforced, has not significantly stopped proposed wetland development activities in Montana.

The two page application form for a 404 permit asks basic common sense information about each project. The application process requires individuals to stop and think and plan before filling a wetland. A detailed look at the reasons why permits were denied, shows that there was good cause for each denial. Additionally, the Corps has, whenever possible, worked with applicants to modify projects that face denial. These modifications appear to have improved the effectiveness of projects and reduced the damage done to aquatic ecosystems.

Given the precious nature of wetlands - a resource that supports a staggering number of Montana's plants and animals, a resource that plays a critical role in flood protection, controlling water pollutants, and protecting water quality - our research indicates that wetlands need more protection, not less.

Our research reveals that the most critical area where Section 404 needs to be strengthened is in the nationwide permit system. The most startling results of our research reveals that, through the use of nationwide permits, valuable Montana wetlands are being "nickel and dimed" out of existence. In Montana, the nationwide permit system is being loosely applied, in large part because of inadequate staffing levels in the local office of the Army Corps of Engineers. It is impossible for either the Corps, or a concerned public, to really know the extent of wetlands losses incurred by Montana under the current nationwide permit system.

The biggest problem with the nationwide permit system, is the assumption that generic nationwide permits fit Montana's wetland resources. For example, under Nationwide Permit # 26, it is assumed that: 1) isolated wetlands under 1 acre in size (70% of a football field) are of no value; and 2) isolated wetlands under ten acres in size (7 football fields in size) are of limited value. In an arid state like Montana, these assumptions do not hold true for our small isolated wetland complexes, complexes that are often seasonal in nature. Individually, these small, isolated wetlands are often the focal point for local biodiversity. Cumulatively, they network to provide critical habitat on a regional basis. They also significantly contribute to both flood control and water quality.

Montana is losing important wetland resources in a piecemeal fashion. Unless current regulations are changed, these precious areas will continue to disappear.

Ormond Beach Observers

DEDICATED TO THE PRESERVATION AND RESTORATION OF WETLANDS

August 2, 1993

Senator Bob Graham
Senate Environment and Public Works Committee
United States Senate
Washington, D.C. 20510

Dear Senator Graham and Committee Members:
Please enter this letter into the Record of your Committee's
hearings on the Clean Water Act.

Wetlands are an important element in our fragile ecosystem.
They provide nutrients for fish populations, migrating and
shore birds, shellfish. Over 43% of our nation's endangered
species are wetland-dependent--higher in California.

Our organization is comprised of 13 groups in Ventura County,
California, and our mission is to protect remnants of coastal
Southern California wetlands (part of the only 5% left in
the state). We believe that wetland protection is essential
to the environmental health of our country.

The midwest flooding of recent weeks has been attributed, in part,
to the lost wetlands (50% in recent years).

Senator Barbara Boxer has introduced legislation, S1195, which
strengthens the wetland protection now in place. We urge
you to support this bill and to encourage other senators to
join you giving a vote of confidence to the environment.

We would appreciate a response to our letter.

Thank you

Sincerely,

Roma Armbrust

SEC. 4. DEFINITION AND DELINEATION OF WETLANDS.

(a) DEFINITIONS.--

I. Amend the definition of jurisdictional wetlands so as to remove and reduce regulation of isolated, low habitat value wetlands.

II. Enact into law a definition of jurisdictional wetlands that incorporates the original 7th Circuit ruling on the Hoffman Homes case. This would exempt isolated wetlands from the reach of Section 404. Most coastal wetlands, as well as those along major rivers and streams, would remain subject to Section 404.

(b) DELINEATION OF WETLANDS.--

I. Devise a regulatory scheme for classifying and discriminating wetlands on the basis of function, value and abundance.

II. HIGH-LOW RANKING SYSTEM

Establish a national regime which classifies wetlands into high, medium or low-value categories. Provide that high-value, scarce wetlands remain subject to a strict regulatory regime akin to the present Section 404 program. At the other end of the spectrum, low value wetlands or wetlands of any value which are abundant would be granted more regulatory flexibility.

A further step would be to set up expedited permitting in those states which retain over 50 percent of the original wetlands in each category. A strict regulatory regime designed to aggressively protect remnant wetlands is not needed in areas where substantial wetlands remain.

III. Adopt a more moderate water dependency test which allows consideration of other factors such as the general character of the state's wetlands.

SEC. 5. REGULATION OF ACTIVITIES.**I. *ANCSA LANDS CONCERNS**

Section 404 unfairly diminishes the value and purpose of lands which were part of the federal government's aboriginal land claims settlement in Alaska. Alaska's Natives were promised 44 million acres, and the right to govern the use of these lands. It's important to consider that over 75% of the lands conveyed to the Native peoples of Alaska are defined as wetlands. As such, compensatory mitigation constitutes an unfair taking of Native lands in many respects.

Federal regulatory processes have eroded the right of the Alaska Natives to use their lands in a manner that will benefit them socially and economically. Reasonable opportunity for economic activity must be allowed to fulfill the purpose of the entitlements and the spirit of the accords. This problem should be corrected. Activities to build the necessary infrastructure to accommodate community economic development should be unhampered by excessive & extra federal regulation on native lands.

* (Alaska Native Claims Settlement Act)

SEC. 6. PERMIT PROCESSING IMPROVEMENTS.

I. Eliminate the concept of rigid sequencing embodied in the Army Corps of Engineers-EPA Memorandum of Agreement (MOA) so as to ensure flexibility in the consideration of mitigation proposals.

II. Require a broader focus on and consideration of public interests in the permitting process.

III. EXEMPTION FROM MITIGATION REQUIREMENTS

Under certain circumstances, a state could be exempted from the alternatives and compensatory mitigation steps of sequencing. Eligibility criteria for the exemption could be as follows:

- a. any state with X percent of its original wetlands still intact;
- b. any state that has X acres or more of protected wetlands;
- c. any state that has more than 50 percent of its lands in public ownership and more than X percent of those lands committed to conservation purposes; or

A variation would provide that only "high-value" wetlands in certain states remain subject to the alternatives analysis and compensation steps. All other wetlands within an otherwise eligible state would be exempt.

IV. RURAL COMMUNITY CONCERNS

More than 200 rural Alaska villages reflect Third World living conditions; basic human health needs must be elevated to priority status. Such a status is inhibited or prevented by Section 404 regulations. Basic infrastructure development such as potable water systems, roads, housing, schools, medical and transportation facilities, and basic sanitation systems require using land regulated as wetlands, and these problems will be exacerbated by strict regulatory practices.

SEC. 7. GENERAL PERMIT IMPROVEMENTS.

(3) STATE AND LOCAL PROGRAMS.--

I. Streamline the procedures and requirements for state/local assumption of program jurisdiction in general.

II. Specifically - State takeover with expanded flexibility

This option envisions inducing states to take over the Section 404 program by enabling them to run programs with fewer restraints than provided by current COE/EPA program. A qualified state program would preempt federal regulation, but individual permits would be subject to federal review or veto. COE/EPA would be barred from taking back the program unless they can affirmatively demonstrate that the state is failing to properly administer its program. *(For greater detail, a draft of legislative principles will be forwarded upon request.)*

III. Municipalities that have taken measures to limit urban sprawl and subsequent wetlands degradation should not be unduly burdened with stringent regulation, rather they should be given flexibility with regard to further development within the city. Cities that have localized growth and development, thereby limiting development in surrounding municipal areas, should be given flexibility in managing the remaining wetlands within the city.

For instance, a state which has one-third or more of its entire population living in any urban area should be granted extra flexibility in all categories of wetlands, since the net effect of such distribution is to preserve many more acres of wetlands in adjacent settings. Local land planning decisions in such areas should be given priority consideration in permitting decisions, since trade-offs of such a nature are greatly determined on a site-specific and community needs basis.

Additionally, any urban area as defined above, which surrounded by utilized wetlands, adjacent or contiguous, should receive regulatory relief from wetlands permitting since dry lands are scarce, and perhaps more biologically important, to ecosystem diversity in the area.

IV. Require that program modifications or reforms be accomplished through legislation or full administrative procedures, including public notice and comment.

V. Reform the Advanced Identification process so as to prevent its abuse at the expense of landowners and local governments.

SEC. 8. COORDINATION AND CLARIFICATION OF PROGRAM
CONCERNING AGRICULTURAL ACTIVITIES

(d) EXEMPTED ACTIVITIES.--

1. In clarifying what is meant by normal farming, RDC supports the addition of "haying" and "grazing."

Additionally, RDC recommends that the silvaculture language also warrants an addition to include "log storage, transfer and sort yards" which are obviously integral to "harvesting for the production of food, fiber, and forest products" as defined as exempted activities under this section.

SEC. 9. MITIGATION BANKS.

I. MITIGATION BANKING CREDIT

Compensatory mitigation would continue to apply nationwide, as would a prospective mitigation banking system. States which have contributed land to federal and state parks, refuges, preserves and wilderness areas would be provided an advance credit of X percent of the protected acres in the mitigation bank.

Any compensatory mitigation requirements attached to Section 404 permits would be deemed to be satisfied by debiting, on a like wetlands value basis, the advance mitigation credit. Only when that credit was exhausted would actual on-the-ground compensatory mitigation occur.

Alternatively, any state which has protected X percent of its wetlands could be entitled to mitigation banking credit of Y.

Alaska has more wetlands than all the other states combined (at least 170 million acres), and the least wetlands development of any state (less than one-tenth of one percent, or approximately 0.05%). When considering the amount of credit Alaska should be forwarded, it's crucial to consider that Alaska has contributed 62% of all federally designated Wilderness lands, 70% of all park land, and 90% of all wildlife refuge land in the national system.

Of the 170,000,000 million acres of wetlands within the State of Alaska, 62,335,685* million acres or 36.7% are protected in Federal & State Conservation Units. These millions of protected wetlands must be considered when establishing a mitigation banking system that affects Alaska. Alaska must be given credit for the wetlands already protected, otherwise there will be no incentive for other states to preserve wetlands.

- * This number along with all statistics outlined in the addendum were compiled by Robert Senner & Co. and RA Kreig & Associates, November 5, 1989.

ADDENDUM

FEDERAL CONSERVATION UNITS WITHIN THE STATE OF ALASKA

Of 52,841,133 acres in the NATIONAL PARK SYSTEM within the State of Alaska, 12,372,846 or 23% are wetlands.

Of 457,000 acres in the NATIONAL WILD and SCENIC RIVER SYSTEM within the State of Alaska 176,250 or 39% are wetlands.

Of 22,869,467 acres in the NATIONAL FOREST SYSTEM within the State of Alaska 5,603,650 or 25% are wetlands.

Of 73,553,172 acres in the NATIONAL WILDLIFE REFUGE SYSTEM within the State of Alaska 41,228,620 or 56% are wetlands.

Of 2,220,000 acres in the BUREAU OF LAND MANAGEMENT SYSTEM within the State of Alaska 544,000 acres or 25% are wetlands.

• Of 151,940,772 acres in the TOTAL FEDERAL CONSERVATION SYSTEM within the State of Alaska 59,925,366 or 39% are wetlands.

STATE OF ALASKA CONSERVATION UNITS

Of 3,050,991 acres in the STATE PARK SYSTEM within Alaska 408,493 or 13% are wetlands.

Of 2,057,000 acres in the STATE FOREST SYSTEM within Alaska 374,700 or 18% are wetlands.

Of 1,065,308 acres in the STATE GAME REFUGE SYSTEM within Alaska 932,573 or 88% are wetlands.

Of 93,568 acres in the STATE GAME SANCTUARY SYSTEM within Alaska 8,870 or 9% are wetlands.

Of 841,940 acres in the STATE CRITICAL HABITAT SYSTEM within Alaska 685,682 or 81% are wetlands.

• Of 7,108,887 acres in the TOTAL STATE CONSERVATION SYSTEM 2,410,319 or 34% are wetlands.

• • • Of 159,049,659 acres in the TOTAL FEDERAL & STATE CONSERVATION SYSTEM within Alaska 62,335,685 or 34% are protected wetlands.

THE WILDLIFE SOCIETY

14 September 1993

The Honorable Bob Graham, Chairman
 Subcommittee on Clean Water, Fisheries, and Wildlife
 U.S. Senate
 SH-524 Hart Senate Office Building
 1 Washington, DC 20510-0903

Dear Mr. Chairman:

The Wildlife Society assembled a Wetlands Technical Committee to prepare the attached report, *MITIGATION BANKING AND WETLANDS CATEGORIZATION: The Need for a National Policy on Wetlands*, for your consideration in addressing wetlands conservation in the Clean Water Act. The Wildlife Society is the scientific and educational association of wildlife professionals dedicated to excellence in wildlife stewardship through science and education.

The Technical Committee consists of experts on wetlands from federal and state government agencies, academia, conservation organizations, industry, and private consulting. This diverse panel of professionals has voluntarily developed this paper in considering the best biological information available on the key issues of MITIGATION BANKING and WETLANDS CATEGORIZATION.

The Society urges you to consider a NET GAIN or NET RECOVERY of wetlands policy in recognition of the enormous historical losses and the importance and array of wetland functions and their inherent values to society.

We would be pleased to meet with you and/or participate in hearings related to wetlands conservation. Please enter this Technical Committee report in the official record of the 15 September hearing on this subject. The Wildlife Society Council will be considering the panel report for adoption at its meeting next week, and we will provide you a copy of the final document when it becomes available.

Thank you for your consideration.

Sincerely,

Thomas M. Franklin

MITIGATION BANKING AND WETLANDS CATEGORIZATION THE NEED FOR
 A NATIONAL POLICY ON WETLANDS

A REPORT FOR THE WILDLIFE SOCIETY

PREPARED BY: THE COMMITTEE ON MITIGATION BANKING AND WETLAND
 CATEGORIZATION

RICHARD D. CRAWFORD; ANN HODGSON HUFFMAN; MARY C. LANDIN; JOSEPH S. LARSON; JOSEPH A. MCGLINCY; DOUGLAS B. INKLEY; RONALD STROMSTAD; MILTON W. WELLER; DAVID E. WESLEY; AND DONALD A. HAMMER, CHAIR

SYNOPSIS

Wetlands represent a small fraction of our Nation's land area, but they harbor an unusually large percentage of our wildlife. Natural wetlands once occupied 11% of the 48 contiguous states and now occupy 5%—a loss of over 50%. Between the mid-1950's and mid-1970's, 700 miles² of wetland were altered and drained each year. The greatest losses were more or less equally balanced between the upper midwest (potholes) and the south (forested and coastal wetland).

An astonishingly rapid reversal of public attitudes and policy towards wetlands occurred during the last 20 years. Wetlands were considered wastelands and society encouraged wetland destruction and conversion with financial incentives. In the 1960's, Massachusetts passed protective legislation and many other states followed. On the national scale, incorporation in the 1972C1 Clean Water Act (CWA) was followed by the 1977 Executive Order leading to modifications in the Corps of Engineers (COE) regulations implementing provisions of the CWA, specifically Section 404. A number of states implemented similar regulations. Unfortunately, none of these efforts represent clearly defined national policy; hence, the confusion, controversy, costs and disenchantment with present approaches. In contrast to wetland drainage, we have not determined and codified a wetland protection/management policy.

Resolution of the present controversy is only possible through public discussion and consensus establishment of a national policy on wetland protection/management embodied in national legislation and unified implementing regulations. Anything less will simply perpetuate the current controversy and eventually undermine support for wetland protection. We need a broad national policy that reduces wetlands loss, restores drained or altered wetlands, protects wetlands through public or private ownership, and enhances wetland functions while accommodating desirable economic development.

The enormous historical losses and the importance and array of wetland functions, and their inherent values to our society, mandates that a national policy implement NET GAIN or NET RECOVERY of wetlands, until 25% of the original wetlands acreage has been restored and our combined wetland resource base is 75% of the original.

Natural wetlands are an ephemeral component of the landscape resulting from geological incidents and to a lesser extent, biological and human activities. Specific location, type and size of every wetland is dependent on a series of geophysical phenomena that created and maintain suitable hydrological and edaphic conditions at that site. Consequently, attempts to preserve every wetland or even to require on-site replacement are in fact attempts to maintain the status quo disregarding the series of unintentional events that created and maintain a wetland. This philosophy is inherent in rigid application of in-kind, on-site restoration/creation requirements of the COE/EPA MOA on mitigation signed in January 1990. In contrast, a strategic, landscape approach might well identify more suitable locations for certain types and sizes or even different types and sizes to enhance one or more functional values to society.

Unfortunately, fear of change has obscured serious consideration of arguments for strategic, landscape planning for wetland management that might increase values of wetlands through judicious location. It also has inhibited restoration of wetlands to their original form and function especially in the coastal regions where freshwater marshes have become saltwater marshes after the intra-coastal and associated canals permitted extensive salt water intrusion. Rigid attempts to maintain the status quo totally disregard historical conditions and man-induced changes, as well as the ever changing, dynamic nature of all wetlands.

Natural wetlands are interdependent and interact with terrestrial components of the landscape and with other wetlands, especially within a watershed or biotic region, such that meaningful management must incorporate a landscape, watershed or biotic region approach. Because of these strong interactions and interdependencies, it is not possible to evaluate, assess or categorize a wetland unit in isolation from other components in the watershed or biotic region. Wetlands management must also include temporal factors since age/successional stage, as well as geographical location, strongly influences both form and function of wetland resources.

The Committee believes that wetlands protective legislation should incorporate a philosophy that bases permit decisions on whether or not we can afford to lose a wetlands, not whether or not the wetlands can be replaced. This is an extension and endorsement of the current philosophy ("the sequencing rules") of:

- 1) encouraging wetland restoration whenever and wherever feasible and practical;
- 2) minimizing detrimental impacts to wetland form and function when avoidance is not feasible or practical; and
- 3) compensating detrimental impacts to wetland form and function when those occur.

We also recommend expanded planning level assessment by state and federal agencies to:

1. Improve and standardize application of current knowledge applicable to wetland evaluation
2. Encourage multi-disciplinary approaches to wetland protection/management;
3. Encourage systems approaches to wetland protection/management;
4. Improve agency consistency in the wetland permit review process; and,
5. Provide advance warning of wetland areas that will require extended review and mitigation.

Because poor scientific understanding of wetlands and their functional values has been an important contributing factor to conflicting attitudes and ambiguous approaches, we are convinced that major new initiatives must be undertaken, requiring substantial funding from public and private partnership, develop adequate knowledge upon which appropriate policies and regulations will be founded. Simply lack the essential information to correctly place wetlands in the landscape and to formulate a sound protection policy and implementing regulations. Consequently, a

national wetland policy must first provide financial resources to develop the requisite information base.

MITIGATION

Despite society's desire to protect remaining wetlands, some water-related projects are impossible without impacting wetlands. Therefore, regulations require compensatory mitigation of wetland impacts if the proposed development is approved. Compensatory mitigation has become a tool that expands the regulators' role from a simple yes or no to one of negotiated development.

Due to the broad scope and many interpretations of the term, we define mitigation as: replacement of the form and function of the wetland that will be detrimentally impacted.

Inclusion of function is important since current mitigation is largely based on replacement of wetland form, i.e., physical components of the impacted wetland. However, replacement of the major components may or may not replace wetland functions depending upon specific functions, wetland form, and spatial and temporal locations.

Numerous compensatory mitigation projects have failed, and these failures are commonly cited as reasons to deny the validity of the concept. Unfortunately, existing information is often not used in restoration, enhancement and creation projects. Failure of many projects lies with the lack of, or improper application of, existing knowledge. Too few developers employ experienced biologists in the design, construction and operation of wetland projects and subsequent failures are predictable.

Certain types of wetland—prairie potholes, midwestern marshes, salt marshes and some forested wetlands—have been successfully restored, enhanced and/or created, but our information on other wetland ecosystems is rudimentary. Similarly, our information on wetland functional values varies considerably. We have the ability to establish some life support functions—waterfowl, wetland mammal, fish and timber production—but only limited information on many other biological products, hydrologic buffering functions and water quality improvement functions. Our ability to replace functional values is limited because of our poor understanding of these functions.

Since compensatory mitigation projects attempting to create new wetlands have had widely varying success rates and because opportunities for wetland restoration or enhancement are finite, regulatory agencies should require natural wetland restoration or enhancement for mitigation rather than creation of new wetland. In situations where restoration or enhancement are not feasible, mitigation in the form of created wetland may be acceptable if:

- 1) documentation is available on the success of projects creating similar types of wetland in that region; or,
- 2) the permittee provides funding for research on similar natural wetlands in the region that would identify means by which the form and function of the impacted wetland could be duplicated in a newly created wetland; and,
- 3) the permittee insures that development of the new wetland is conducted under the direction of competent biologists employing current information or information obtained from studies on the model natural wetland;
- 4) the permittee agrees to provide for long-term monitoring to insure the new wetland is functional and self-perpetuating; and,
- 5) the permittee agrees to provide for long-term financial support through an irrevocable trust to ensure funding for necessary management.

MITIGATION BANKING

Existing regulatory delays and the inability of some developments to avoid detrimentally impacting wetlands led to proposals for establishing wetland banks to facilitate compliance with replacement requirements. Various groups have proposed establishing specific areas where wetlands are protected/restored/created and cooperating parties could receive "credits" for wetlands in the bank that would be used to offset liability for detrimentally impacting wetlands in a new development.

Current delays and lengthy regulatory processes reflect:

- 1) the complexity of wetlands and our inability to adequately evaluate functional values and insure replacement of form and function through mitigation; and,
- 2) inability of regulatory agencies to agree on and implement standardized permit processing procedures.

The present regulatory quagmire serves neither to protect wetlands nor their functional values, accomplish no-net loss or net-gain, nor to accommodate economic development in an orderly, cost effective manner. Present regulations, in some in-

stances, may contravene society's goals to protect and restore wetlands, and current wetland regulations need to have more latitude to encourage and support wetland restoration/creation projects by various organizations. Increased regulatory flexibility must include pro-active acquisition and long-term management if compensatory mitigation and mitigation banking are to protect and restore our Nation's wetland resources.

Economics are part of natural resources management and are certainly no reason to oppose the concept of wetland mitigation banks. Furthermore, opposition is no longer timely. Mitigation banks and banking programs are increasing almost exponentially. Preliminary results from the COE mitigation banking survey indicate existing banks had increased from 13 in 1988 to 20 in 1991 with at least 100 in active or planning status in 1992.

What impact do mitigation banks have on the Nation's wetland and wildlife resources and can current rigid regulatory applications be modified to achieve the goal of minimizing loss, and maintaining and restoring wetland functions? Do we achieve better quality management for wetland resources within the structure of mitigation banking than without it? Mitigation banking gambles that focusing efforts on fewer and more significant wetlands will have positive results for the landscape, even though centralization of those elements, and loss of peripheral elements, may have some negative effects.

Mitigation banking may have many positive as well as negative impacts on wildlife, wetlands and society and a summary of each is included the report. Wildlife scientists and managers must initiate a pro-active approach to mitigation and mitigation banking and develop guidelines that will respond to the needs of developers and accomplish a net gain in wetland resources. More over, the policy must increase wetland form and functional values and concurrently reduce and standardize regulatory requirements.

CATEGORIZATION

Classification and categorization are useful tools in ordering chaos. Wetland classification generally represents groupings of wetlands on hydrologic, biologic and edaphic characteristics without including value judgments. Categorization, however, implies grouping wetlands based on a value regime.

Value is determined by society and is not an inherent characteristic. Value has socioeconomic implications that go far beyond an assessment of presence or absence or even quantitative measurements. Valuation is also a function of time in that society's values change, and therefore the very same wetland could have a very different perceived value in the same society at a different point in time. If valuation schemes are employed to Categorize wetlands, evaluators must be able to estimate future values, as well as adequately assess present values, of existing wetlands. Furthermore evaluation of a wetland is inevitably related to time of year and age of system. Wetlands are dynamic ecosystems undergoing seasonal and annual change as well as progressive change over time, as the wetland system ages. Time, techniques and location of data collection can have substantial impact on the result of a one-time evaluation.

We recognize the importance of evaluation of natural resources as an important basis for land use decision making. Regulatory agencies now engage in wetland assessment as they decide what level of review is necessary when permits are filed. But the basis for this decision is not clear, interpretable or available to the permit applicant in advance.

A method of evaluating wetlands to determine the appropriate category for each individual wetland must be a key element of any categorization proposal. We are familiar with widely used evaluation methods (technical assessment tools). We do not believe that any existing evaluation regime is adequate to measure the value of each function performed by the myriad of types of natural wetlands in the U.S. Consequently, any attempt to evaluate and subsequently categorize natural wetlands with existing methodologies would result in irretrievable harm to the Nation's wetland and wildlife resources.

For the vast majority of wetlands and even for most different types of wetland, we lack quantitative information even on the biologic productivity, much less adequate, comparable information on other important functional values. We are aware of the potential costs of assessing the functions of individual wetlands; however, it is also clear that careful and costly study of watersheds is a prerequisite to designing flood protection programs. Wetlands must be included in similarly comprehensive watershed planning. Wetlands are providing important functions in maintaining water quality, reducing flood damage and conserving biological diversity, and their man-

agement requires an appropriate public investment in data collection and functional assessment.

We are concerned that some categorization proposals would allow for valuation/categorization by non-wetland professionals, i.e., developers or engineers. We do not believe that other disciplines are competent to evaluate wetlands or wetland functional values and we disagree with these approaches.

The Committee is concerned that certain proposals for categorization do not distinguish among several functions of wetlands, and lump values, such as flood control and wildlife habitat that have different biological and physical bases, into a few simple "value" classes. Schemes to put wetlands into nation-wide value classes without providing for any process to distinguish between regional differences are similarly suspect. In addition, some categorization proposals appear to have a strong element of triage, i.e., if wetlands were assigned to high (Type A), medium (Type B) and low value (Type C) categories, the Committee is concerned that wetlands in the low value category would receive less protection than they currently are provided, allowing development and subsequent loss of "low value" wetlands when in fact, their value is largely unknown.

Finally, high priority must be given to funding research to develop improved techniques and methodologies to quantify the functional values of wetlands and effects of wetland alterations. This research should develop an objective, quantitative, evaluation process that can be coupled with the National Wetlands Inventory. Similar research is urgently needed to improve methods to create compensatory wetlands that provide important wetland functions.

INTRODUCTION

Natural wetlands once occupied 11% of the 48 contiguous states but now occupy only 5%—a loss of over 50%. Wetlands represent a very small fraction of our total land area, but they harbor an unusually large percentage of our nation's wildlife. For example, 900 species of wildlife in the United States require wetland habitats at some stage in their life cycle, with an even greater number using wetlands periodically. Representatives from almost all avian groups use wetland to some extent and one-third of North American bird species rely directly on wetlands for some resource (Feierabend, 1989).

Between the mid-1950's and mid-1970's, a proximately 700 miles² of wetland were altered and drained nationwide each year according to the National Wetlands Inventory status and trends reports (Dahl and Johnson 1990). While losses were nationwide, most were more or less equally balanced between the upper midwest (pot-holes) and the south (forested wetland). Nineteen states lost over 50% of their wetlands and Ohio and California lost over 90%. A second status and trends report for the mid-1970's to the mid-1980's found a significant reduction in the loss rate, but losses continued at 300 miles² per year. During this period the largest losses occurred in the south (primarily forested but also coastal wetland). Most wetland losses were caused or induced by human activities.

The last 20 years have witnessed an astonishingly rapid reversal of public attitudes and policy towards wetlands. For over 100 years, public attitudes embodied in consensus policy, considered wetlands as "wastelands" and encouraged wetland destruction and conversion with financial incentives. But in the 1960's, Massachusetts passed legislation requiring a state permit for any alteration of wetland and many other states followed. On the national scale, growing public awareness of wetland values led to equivocal incorporation in the 1972 Clean Water Act (CWA) followed by the 1977 Executive Order but E.O.'s only apply to actions of Federal agencies. This however, led to modifications in the U.S.A. Corps of Engineers (COE) regulations implementing provisions of the CWA, specifically Section 404, see Appendix A. Later a number of states implemented similar regulations. Unfortunately, none of these represent clearly defined national policy; hence, the confusion, controversy, costs and disenchantment with present approaches. In contrast to wetland drainage, we have not determined and codified a wetland protection/management policy.

Reversing the drainage/conversion policy probably could not have been accomplished 20-30 years ago, but increasing public awareness and support are the basis for present concern over wetlands protection and the controversy surrounding wetland regulations. The Committee is convinced that resolution of the present controversy over wetland protection is only possible through adequate public discussion and consensus establishment of a national policy on wetland protection/management embodied in national legislation and unified implementing regulations. Anything less will simply perpetuate the current controversy and eventually undermine future support for wetland protection. We Need a broad national policy that addresses regulations and incentives to reduce wetland loss, protects wetlands through

public or private ownership, restores drained or altered wetland, and enhances wetland functions. Only a national wetland policy that repudiates previous conversion policies and encourages/compels wetland protection/restoration/creation/management will reverse continuing losses while accommodating desirable economic development.

The enormous historical losses of national wetlands and the importance and wide array of wetland functions and their inherent values to our society, mandates that we go beyond a national policy of NO NET LOSS of wetlands. We must implement a NET GAIN or NET RECOVERY of wetlands policy until such time as the combined wetland resource base approximates 75% of the original base. Since the present base is estimated at approximately 50% of the original, this would entail restoration of some 25% of the Nation's natural wetland acreages. And it will likely include creation of considerable wetland acreages since many former wetlands could be costly to restore. Many of our most important wildlife species are inextricably dependent on wetlands and diminished populations of these species are unlikely to be restored without restoration or creation of a significant portion of the wetland habitats they require.

Natural wetlands are an ephemeral component of the landscape that largely result from geological incidents and to a lesser extent, from biological and human activities. Specific location, type and size of every wetland is dependent on a series of geophysical phenomena that created and maintain suitable hydrological and edaphic conditions at that site. Consequently, attempts to preserve every wetland or even to require on-site replacement are in fact attempts to maintain the status quo disregarding the series of unintentional events that created and maintain a wetland on that specific site. This philosophy is inherent in rigid application of in-kind, on-site restoration/creation requirements of the COE/EPA MOA on mitigation signed in January 1990. In contrast, a strategic, landscape approach might well identify more suitable locations for certain types and sizes or even different types and sizes to enhance one or more of the functional values to society.

Unfortunately, fear of change has obscured serious consideration of arguments for strategic, landscape planning for wetland management that might increase the values of wetland through judicious location. It also has inhibited restoration of wetlands to their original form and function especially in the coastal regions where freshwater marshes have become saltwater marshes after the intra-coastal and associated canals permitted extensive salt water intrusion. For example, in Texaco's Bessy Height's field near Port Arthur, Texas, cypress stumps are still prominent in a saltwater marsh but the regulatory process discourages efforts to restore the original freshwater marshes. Required permitting contravenes the goal of restoring freshwater wetlands on sites where those wetlands previously existed despite the fact that salt water intrusion resulted from man-induced and not natural changes. Rigid attempts to maintain the status quo totally disregard historical conditions and man-induced changes, as well as the ever changing, dynamic nature of all wetlands.

Wetlands interactions and interdependencies in a watershed negate management approaches based on evaluating potential impacts to discrete wetland units. Current site specific approaches, especially regulatory measures, to wetland resources management are inadequate to conserve or restore the Nation's wetland and wildlife resources. Natural wetlands are interdependent and interact with terrestrial components of the landscape and with other wetlands, especially within a watershed or biotic region, such that meaningful management must incorporate a landscape, watershed or biotic region approach. Because of these strong interactions and interdependencies, it is not possible to evaluate, assess or categorize a wetland unit in isolation from other components in the watershed or biotic region. Wetlands management must also include temporal factors since age/successional stage as well as geographical location, strongly influences both form and function of wetland resources. For example, small isolated wetlands strategically located throughout a watershed may have considerably more value in terms of flood amelioration and water quality improvement than a single, large wetland at one position, even though it may be situated at the lower end of the watershed. Relatively, narrow bands of riparian vegetation may have inordinate importance as travel lanes for some species of wild life. Consequently, wetland resource management must include the context of the surroundings on a watershed, landscape or biogeographical unit basis.

In recognizing the complex of hydrologic, biologic, and edaphic components and processes that combine to create and maintain viable wetland ecosystems, the Committee recommends that management efforts and programs employ multi-disciplinary and system analysis approaches to insure adequate representation and evaluation of all aspects of wetland ecosystems. Managers must also incorporate cumulative/multiple impact assessments to wetland resources (and other natural resources)

within a hydrological or biogeographical unit since loss or damage to a single wetland could have serious repercussions to the functional values from remaining wetlands (and other resources) within the hydro/bio/geographical unit.

Because of the wide distribution and permeating impacts on world-wide public health, safety and welfare, wetland management must also adopt an international approach in developing a basic philosophy to reverse the loss of additional wetlands and instead, encourage restoration and replacement of previously lost wetlands throughout the world.

The Committee believes that wetlands protective legislation should incorporate a philosophy that bases permit decisions on whether or not we can afford to lose a wetland, not whether or not the wetlands can be replaced. This is an extension and endorsement of the current philosophy ("the sequencing rules") of:

- 1) encouraging wetland restoration whenever and wherever feasible and practical;
- 2) avoiding further loss or degradation of the Nation's wetland resources;
- 3) minimizing detrimental impacts to wetland form and function when avoidance is not feasible or practical; and
- 4) compensation of detrimental impacts to wetland form and function when those occur.

Wetland resource management must employ these approaches in descending order of priority, i.e., compensatory Impact mitigation is the last resort, to be implemented only when avoidance and minimization of impacts are not feasible or practical. Restoration or creation must not be used to mitigate avoidable destruction unless it has been thoroughly demonstrated that the replacement wetlands have equal or better form and function.

Where compensatory mitigation is required, acquisition of previous or degraded wetland and restoration, should take precedence over attempts at creation of new wetland because of the indifferent history of creation projects. Certain types of wetland may be relatively easily created, but our knowledge of many other wetland types is inadequate and numerous attempts to create these wetlands have been less than successful. Granted, failure of many projects was due to the lack of, or poor application of, existing knowledge—the developers lacked proper expertise (Erwin, 1991; Landin 192). And many other failures were related to overly ambitious goals or objectives, unrealistic time frames and/or inadequate resources. However, even successful creation projects will require continued maintenance/management for the foreseeable future. Unless responsibilities and resources are funded by long-term financial commitments, the end result may not be viable wetland ecosystems.

Changes in society's attitudes towards wetlands resulted from characterization and education on wetlands worth to the public, i.e., the quantitative and qualitative benefits that society derives simply because the wetland exists in that location. Benefits that result from the processes or functions carried out by the wetlands may have significant values. To create a direct linkage between wetland functions and value to society, we define functional values as: those products and effects resulting from the natural processes and functions of a wetland that have economic, educational, recreational and social impacts (positive and negative) on various segments of society.

Because poor scientific understanding of wetlands and their functional values has been an important contributing factor to conflicting attitudes and ambiguous approaches, the Committee is convinced that major new initiatives must be undertaken, requiring substantial funding from public and private partnerships, to develop adequate knowledge upon which appropriate policies and regulations will be founded. We reject arguments that it would be too costly to identify, categorize and classify all wetlands in order to implement wetland management policies. We believe that a complete understanding of all the functional values for each and every wetland regardless of size is unnecessary. None the less, our present knowledge base lacks the ability to evaluate important functional values for major wetland categories or to designate major interchange relationships within the landscape. We simply lack the essential ability to identify, describe, evaluate, and place wetlands in the landscape and to formulate a sound national policy and implementing regulations.

Previous failures to provide adequate funding for wetland inventory and research have been costly to society due to extensive loss of functional values and their economic benefits. For example, nonpoint source pollution is frequently cited as the largest remaining contributor to water quality problems, and improper resource management is identified as the culprit. Doubtless, poor land management is a factor, but rural land management is generally better today than 50 years ago when water pollution was less severe. Recently we have learned that 10-20 acres of constructed wetland can provide high level treatment for municipal wastewaters from

1000 residents for 10-50% of the \$3-4 million costs of conventional treatment systems (Hammer 1991). How much was the natural wetland worth before it was destroyed? And 100 year floods seem to occur at 10 or even 5 year intervals despite the fact that a much larger percentage of rural land is vegetated. Over harvest has been important in the depletion of fishery stocks but what has been the contribution of lost wetland nurseries? The critical element may well be natural wetlands that previously protected society from the ill effects of flooding and water contamination and provided the foundation for larger fish/food populations. Loss of natural wetlands has been costly to society and attempts to reverse those losses are unlikely to recover significant benefits without an adequate understanding of wetlands, their functional values and their importance in the landscape.

Significant increases in funding for:

- 1) research on functional values, including economic benefits;
- 2) landscape interchanges and interactions;
- 3) inventory;
- 4) classification and categorization; and,
- 5) wetland restoration/creation methods.

are critical to recovering financial losses to society caused by previous costly subsidies supporting drainage/conversion programs.

MITIGATION

Despite society's desire to protect remaining wetland resources through positive efforts to avoid and minimize wetland impacts (the sequencing rules), certain types of developments, such as water-related projects, are impossible without detrimentally impacting on-site wetlands. Therefore protective regulations include a third category requiring compensatory mitigation of wetland impacts' in cases where wetlands will inevitably be impacted if the proposed development is approved. Under current philosophies, compensatory mitigation must occur only after avoidance and minimization of impacts have been attempted. In its simplest form, compensatory mitigation allows the regulatory agency to say yes to development with a series of requirements. In that sense, mitigation is a tool that expands the regulators role from a simple yes or no to one of negotiated development. However, it is important to maintain our perspective. Mitigation banking is only applicable within the prescribed wetland regulatory process; at present non-regulatory wetlands (those built for other than mitigation purposes) account or 99% of all man-made wetland restoration and creation. Mitigation cure to the wetland loss problem. It is only one tool, in a bag of tools, that we have to protect/manage the nation's wetland resources.

Due to the broad scope and many interpretations of the term, the Committee defines mitigation as: replacement of the form and function of the wetland that will be detrimentally impacted.

This definition deliberately excludes the concept of minimizing harm from mitigation, though the latter often is included. We have deliberately avoiding specifying locations, acreages, creation, restoration, enhancement, etc. in an effort to simplify the definition because we recognize that full replacement may be accomplished through a variety of means. Since our charge is to evaluate impacts of mitigation banks on wildlife and wetlands, we chose to restrict the definition and limit our discussion to the concept.

Our inclusion of function within the above definition is important since we believe that current mitigation is largely based on replacement of wetland form, i.e., the physical components of the impacted wetland. However, replacement of the major components may or may not replace the wetland functions depending upon the specific functions, the wetland form and spatial and temporal locations. However, given that definition, we must then examine the viability of the basic approach to replacement. Since mitigation assumes that the form and functions of the wetland can be replaced, a review of wetland functions may be useful.

Important functional values deriving to human societies from natural wetlands include:

ground-water recharge, ground-water discharge, floodwater alteration, sediment stabilization, sediment/toxicant retention, nutrient removal/transformation, production export, aquatic and wildlife diversity/abundance, storm buffering, recreation and uniqueness/heritage (Adamus, et al 1991).

This list may be grouped into four major categories:

- 1) life support;
- 2) hydrologic buffering;
- 3) water quality improvements; and,

4) historical/cultural significance.

Because wetland functions are controlled by physical, chemical and biological processes, wetland functions are strongly related to complexity, pristiness (diversity), size and location of the wetland as follows:

	Complexity	Pristine	Size	Location
Life Support	High	High	High	Mod
Hydro Buff	Low	Low	Mod	High
W Q Improve	Low	Low	Low	Mod
Histor/Cult	Low	High	Mod	High

Life support is largely biological though obviously dependent on physical and chemical processes. It has moderate site dependency with moderate to high size, complexity and pristine dependency. It includes production and maintenance of flora and fauna—forbs, grasses, shrubs, trees, fungi, invertebrates, birds, mammals, fishes, herptiles, and microbial populations that are valued for commercial products and recreation.

Hydrologic buffering is largely a physical function that is extremely site dependent and highly size related. It includes flood amelioration such as flood water storage/retention, i.e., desynchronization and reductions in magnitude of downstream flows reducing flood water damages during unusual storm events. Conversely, delayed discharges of flood waters augment base flows in rivers and streams supporting diverse aquatic life in our waterways. In some instances wetlands can have an important groundwater recharge function, supplementing other mechanisms to increase total ground water resources. Natural wetlands protecting and supported by groundwater discharge can provide important surface water sources and of course, some wetlands have essentially flow-through groundwater patterns (Clark and Benforado 1981, Gosselink et al 1990, Gosselink and Turner 1978).

In the water quality improvement function, chemical and physical processes tend to dominate biological processes. This function has moderate site dependency and lower size, complexity and pristine dependency. It includes removal of pollutants/contaminants from in flowing waters—principally surface flows—but it can also include subsurface inflows—to purify natural water supplies. Principle actions include (Faulkner and Richardson 1989):

- 1) chemical—oxidation, reduction, cation exchange, adsorption, precipitation;
- 2) physical—sedimentation, filtration, precipitation; and,
- 3) biological—microbially mediated reactions, assimilation/uptake, nutrient recycling.

The historical/cultural preservation function is highly site specific and strongly related to natural condition but only moderately related to size and complexity of the wetland. It includes preservation of anthropological and historical resources.

Physical and chemical processes are much less dependent upon complex, diverse and perhaps pristine wetland. A very simple or severely degraded system may have important hydrologic buffering value and/or water quality improvement values but little or no life support value. Generally, life support values increase with increasing complexity and proximity to natural conditions. However, a simple wetland (low diversity/complexity) can have very high productivity for certain products. A small system (perhaps 0.1 ha) may have important water quality improvement values but little or no flood amelioration or life support value. Exceptions include very small systems that provide habitat for unusual or threatened or endangered species. Moderate size (> 2 ha) systems may have significant hydrologic and life support values and increasing size is related to increasing importance for these values. Obviously, location in the watershed is extremely important to the hydrologic buffering function and moderately important to water quality but may be much less important to the life support function. Location in a state, region, country or continent may be quite important to the life support function, however.

Numerous compensatory mitigation projects have failed, and these failures are commonly cited as reasons to deny the validity of the concept. Given the broad variety of wetland types, their geographic distribution, and diverse nature of wetland functional values, generalizations are fraught with peril. This is especially true for

smaller wetlands and unique types with isolated distributions. Furthermore, the interrelationships of wetland units within a geographic area and their interdependencies on associated terrestrial environments, make evaluations of replacement difficult at best. However, certain types of wetland have been restored, enhanced and/or created for many years. We have a considerable body of knowledge on restoration, enhancement, creation and management of marshes—especially the Prairie Potholes and other midwestern marshes. Similar though less extensive information is available for freshwater marshes in the interior valley of California, the Intermountain West and coastal marshes along the Atlantic and Gulf coasts. Some information is available for northern bogs, less for Coastal Plain bogs and very little for high elevation bogs. Our information on forested wetlands, especially the great river swamps of the Southeast is rudimentary at best and it's almost non-existent for unique systems such as pocosins, vernal pools, riparian bands, Carolina Bays, etc.

Similarly, our information base on wetland functional values varies considerably. We have the ability to accomplish certain life support functions—notably waterfowl, wetland mammal, fish and timber production but only limited information on the host of other biological products deriving from wetlands. Very few investigations have explored the hydrologic buffering functions and results have been multi-directional. The water quality improvement function has received considerable attention within the last few years but much of the information has derived from deliberately constructed wetlands and extrapolation to natural wetlands is largely unknown. Consequently, our ability to replace functional values, with a few exceptions, is limited because of our poor understanding of these functions. We do not believe that the state of the art for functional values is adequate to enable us to replace these functions in most newly created wetlands.

Unfortunately, existing information is often not used in restoration, enhancement and creation projects. Failure of many projects lies with the lack of, or improper application of, existing knowledge. In most cases, problems are caused in application not by the science. Too few developers employ experienced biologists in the design, construction and operation of wetland projects and subsequent failures are predictable.

Since compensatory mitigation projects that attempted to create new wetlands have had widely varying success rates and because opportunities for wetland restoration or enhancement are finite, regulatory agencies should require natural wetland restoration or enhancement for mitigation rather than creation of new wetland. Our emphasis on restoring former or prior-existing wetland is pragmatic in that, in many cases, restoration of damaged or degraded wetland is much more likely to succeed than attempts to create a wetland in a formerly terrestrial environment. Quite simply, the residual hydrology, edaphic and biological components in the previous wetland make it possible to restore the wetland simply by removing or modifying the factors causing degradation.

In situations where restoration or enhancement are not feasible, mitigation in the form of created wetland may be acceptable if:

- 1) documentation is available on the success of projects creating similar types of wetland in that region; or,
- 2) the permittee provides funding for research on similar natural wetlands in the region that would identify means by which the form and function of the impacted wetland could be duplicated in a newly created wetland; and,
- 3) the permittee insures that development of the new wetland is conducted under the direction of competent biologists employing current information or information obtained from studies on the model natural wetland; and
- 4) the permittee agrees to provide for long-term monitoring to insure the new wetland is functional and self-perpetuating.

Although various agencies and individual offices of these agencies have developed replacement acreage requirements, the Committee is reluctant to delve into that morass. Suffice it to say, that replacement of functions for an individual wetland could easily require replacement at ratios greater than 1:1 depending upon the functions and the time period during which the replacement is expected to be accomplished.

MITIGATION BANKING

The complex web of regulations and the inability of some developments to avoid detrimentally impacting wetlands has led to the concept of replacing wetland in various forms or systems. Costs for complying with current regulations and uncertainties over permit delays and/or approvals have encouraged proposals for establishing banks of protected/restored/created wetland that could facilitate compliance with the replacement requirements. In a further attempt to expedite regulatory re-

views various groups have proposed establishing specific areas where wetlands are protected/restored/created and cooperating parties could receive "credits" for wetlands in the bank that would be used to offset their liability for detrimentally impacting a wetland in a new development. Developers, often caught in a confusing, seemingly interminable web of unknowns related to potentially impacting a wetland as part of their overall development proposal, are leading advocates. And it is understandable that developers seek a simplified solution; many simply ask that they be told what it will cost and when a permit will be issued so they can factor the delay and cost into their project planning.

However, current delays and lengthy regulatory processes reflect:

- 1) the complexity of wetlands and our inability to adequately evaluate functional values and insure replacement of form and function through mitigation; and,
- 2) inability of regulatory agencies to agree on and implement standardized permit processing procedures.

The present regulatory quagmire serves neither to protect all wetlands or their functional values, accomplish no-net loss or net-gain, nor to accommodate economic development in an orderly, cost-effective manner. Some would say that the current regulatory approach fails to provide adequate protection while others fault the interminable, costly delays and inability to plan developments. Others cite the continued, often piecemeal, loss of thousands of acres of wetland and our failure to implement no-net loss on a local, regional, state or national basis much less accomplish any improvements in restoring wetlands and their functional values. Many examples of disparate implementation of regulations have also been articulated. Forceful arguments can doubtless be made for both sides of the issue. The present controversy regarding wetland protection is not surprising given the short time period for an almost complete reversal of a long established drainage policy. But our poor scientific understanding of wetlands has also been a contributing factor.

Economics are part of all natural resources management and are certainly no reason to oppose the concept of wetland mitigation banks. Furthermore, opposition is no Mitigation banks and banking programs are increasing almost exponentially and developers are leading the efforts while environmentalists often find themselves on the outside in opposition. A progress report on the COE mitigation banking survey (IWR 1992) showed that existing banks had increased from 13 in 1988 to 20 in 1991 with at least 100 in active or planning status in 1992. The survey identified 37 existing banks with 64 planned banks that were expected to become active in 1992, and an additional 5 mitigation trusts. Of the existing banks, 38% are on the west coast, 27% in the northern plains, with 16% in each of the mid Atlantic and Gulf regions. Highway construction projects were involved in 60% of the banks and port (14%) and industrial development (11%) were the next most common. States exclusively own 50% of the banks, 20% are privately owned, and local public bodies and federal ownership account for another 20%. The largest was 7000 acres but only 15% were >640 acres, while 51 were >40 acres and only 5% were <10 acres. Over two-thirds were located in the same hydrologic unit.

The relevant question now is what impact do mitigation banks have on the Nation's wetland and wildlife resources and can current rigid regulatory applications be modified to achieve the goal of minimizing loss, and maintaining and restoring wetland functions. Do we achieve better quality management for wetland resources within the structure of mitigation banking than without it? A mitigation bank, in its Usual form, gambles that focusing efforts on fewer and more significant wetlands will have positive results or the landscape, even though centralization of those elements, and loss of peripheral elements may have some negative effects.

The effects of mitigation banking on wildlife, wetlands and society, have positive and negative aspects. Mitigation banking pluses include:

- 1) alternatives for improving quantity of high quality wetlands as well as acquisition and management opportunities
- 2) opportunities for restoration of degraded wetlands;
- 3) increased diversity and isolation for wildlife species;
- 4) scale, size and location improvements if regulators and developers are required to employ a landscape
- 5) preservation of existing habitats through acquisition and management;
- 6) better adherence to fish and wildlife needs;
- 7) exploits new management opportunities and approaches;
- 8) potential for a net gain of wetland if creation is successful;
- 9) better technical and professional expertise are likely to be available on larger projects;

- 10) greater involvement and possible cash flow for owners of lands that now have little market value;
- 11) facilitates conflict resolution;
- 12) reduced delays encountered by developers; could provide clear direction to developers and enhance their ability to estimate total project costs; gives developers a degree of certainty in terms of permit approvals and timing so they can deal with banks, other funding sources and planning agencies; could be seen as positive effort by environmentalists to work with developers; and, could positively influence developers attitudes towards wetlands and wildlife in general;
- 13) mitigation banking could create greater acceptance and understanding in the regulated community of wetland functions and values that might encourage deliberate use of created/constructed wetlands in development projects.

Mitigation banking negatives include:

- 1) converting to wetlands can cause loss of other habitats especially certain terrestrial habitats.
- 2) influencing the natural distribution of wetlands;
- 3) altering types of wetlands;
- 4) altering functions of wetlands;
- 5) impacting size (including sacrificing many small wetlands for one large wetland);
- 6) increasing regulatory requirements;
- 7) potential losses of wetland since enforcement in mitigation banks has been poor or lacking;
- 8) potential losses due to lack of long-term funding. Many projects lack provisions for management and funding in perpetuity; can guaranteed, long-term funding be provided and who will be responsible for long term management?

The Committee believes that wildlife scientists and managers must initiate a proactive approach to mitigation and mitigation banking and develop guidelines for mitigation and mitigation banks that will respond to the needs of developers and accomplish a net gain in wetland resources. Developing and promoting a program/policy to enhance the positive resource aspects of banking while reducing the negative we an impacts and improving regulatory conditions for developers could become a win-win situation. However, the policy must increase wetland form and functional values and concurrently reduce and standardize regulatory requirements. The Institute of Water Resources Survey currently underway is likely to provide additional information in the near future. However, in the interim, the mitigation banking policy should include:

- 1) recognition that the basic precepts of mitigation banking are:
 - economic and development driven
 - permit driven
 - not altruistic
 must deal with areal scale
 - ownership (covenant codes and restrictions)
 - administration
 - continuity
- 2) national guidelines and oversight as part of a national wetland policy;
- 3) regional modifications/specifics;
- 4) state or regional level decision making and implementation;
- 5) administration by joint private/state/federal consortia established for that specific purpose. Mitigation banks must be established and managed by cooperative agreements among various organizations and not necessarily controlled by government. COE and EPA are unlikely to actually manage banks, but will only regulate them. On the other hand, many existing private organizations could provide long-term management and new consortia of private and governmental organizations could be established for the specific purpose of providing funding and management in perpetuity. We must develop means to provide for permanent protection and management of wetlands in any mitigation bank;
- 6) compensatory mitigation should include ecological equivalency as a specific goal including replacement/increase of form and functions;
- 7) compensatory mitigation should include landscape, watershed and hydro/bio/geographical evaluations;
- 8) general guidelines on within-kind vs out-of-kind, within-site vs off-site, near- or far-site, in- or out-of biotic/hydro/geographic region that are designed to increase the acreages, form and functional values of wetland that will be refined at state or regional levels;

- 9) establishment of escrow/trust funds or other means to ensure funding for full implementation and long term management; funding of the mitigation bank must not be susceptible to company failure/bankruptcy or reorganization;
- 10) improved methods/means to provide, record and monitor mitigation credits, including guidelines for third party brokering of mitigation credits;
- 11) less regulatory attention to the permit that leads to a decision of "yes, you may develop this wet following mitigation stipulations," and more followup on what was actually done. Federal agencies have done a very poor job of monitoring wetland permit compliance once the permit was grant.
- 12) reduced regulatory requirements to improve opportunities for net gain to wetlands and wetland resources.
- 13) requirements for incorporation of wetland science with careful, conscientious planning and construction for any mitigation projects to reduce the amount of poor planning and execution.
- 14) requirements that mitigation is in place and functioning, concurrent or a priori other aspects of the project. Current regulations are largely tied to the same time line as the developer's project. Regulations must have the flexibility to allow for accumulation of mitigation credits in banks prior to and/or concurrent with loss of the natural wetland. In to many instances, developer's cash flow problems have caused mitigation failures. In other cases, a priori mitigation may be necessary to insure that mitigation projects will succeed before the development is initiated.
- 15) guidelines on locations, type, size and establishment of mitigation banks including how acreages/form/function are established/accepted in the banks;
- 16) clear, quantifiable goals must be set for each of the mitigation banks; goals that have measurable outputs.
- 17) each mitigation bank plan and program must contain a monitoring and evaluation plan and funding to achieve that plan.
- 18) application of mitigation banking credits must be such that credits are not transferable from one project to another without adequate evaluation by qualified professionals. This seems to be occurring in the Upper Yazoo Basin Restudy Effort by the COE. Apparently, the COE has indicated that they have "over mitigated" in the Upper Steele Bayou project (located in the Mississippi Delta) by some 12% and plan to move these "excess" credits to the Upper Yazoo project (also Mississippi Delta) for mitigation application. While this may result in acceptable mitigation in these two comparable drainages, the practice certainly requires scrutiny.
- 19) recognition that education is an important goal of mitigation not only for the public but for specific user groups and resource managers. Also recognition that wetlands are not only important in terms of wildlife but for many other functional values.

Present regulations, in some instances, may contravene society's goals to protect and restore wetlands and current wetland regulations need to have more latitude to encourage and support wetland restoration/creation projects by various organizations. Increased regulatory flexibility must include pro-active acquisition and long-term management if compensatory mitigation and mitigation banking are to protect and restore our Nation's wetland resources.

An example of an active mitigation banking scheme—North Dakota's no net loss of wetland law—is described in Appendix B.

CATEGORIZATION

Classification and categorization are useful tools in ordering chaos whether the subjects are insects, stamps, job descriptions or wetlands. Wetlands classification is generally understood to represent groupings of wetlands based on their hydrologic, biologic and edaphic characteristics without any attempt to include a value judgment on one group or another. Categorization, however, implies grouping wetlands based on some form of assigned value regime.

Valuation or determining/assigning values by nature must include by whom, for whom, and for what purpose. The value of something is determined by society and is not an inherent characteristic, i.e., flood alteration function of a specific wetland could have significant value to a downstream community yet lack any value to an upstream community. Value has socioeconomic implications that go far beyond an assessment of presence or absence or even quantitative measurements. Valuation is also a function of time in that society's values change, and therefore the very same wetland could have a very different perceived value in the same society at a different point in time.

The Committee recognizes the importance of evaluation of natural resources as an important basis for making decisions concerning land use. Mapping and scientific assessment of soils and forest stands has long been recognized as essential to prudent management of agricultural and forest resources. Wetlands resources likewise must have a similar level of assessment and hasty legislation to lump wetlands into categories without a sound science base will put health, safety and welfare at unwarranted risk.

We regularly put wetlands and other resources in different categories for management and protection without reducing the effectiveness of management programs. EPA makes advance designation of wetlands under the 404 program, the FWS designates wetlands for the RAMSAR list of Wetlands of International Importance and has identified high priority wetlands for each region of the count. Biosphere Reserves and Natural Heritage Sites are other well recognized categories that do not reduce the value of the basic resource.

The Committee also recognizes that wetlands regulatory agencies are already engaged in wetland valuation as they decide what level of review is necessary when permits are filed. Some permits receive a desk review and others require costly field data and expert consultants. However, in many cases, the basis for this decision is not clear, interpretable or available to the permit applicant in

Some agencies make these assessments in advance of the permit process. COE and EPA make advance designations to advise the public that certain wetland complexes will require more rigorous review. New Hampshire and Connecticut have adopted manuals to guide in identifying prime wetland that will require higher levels of review.

A key element of current categorization proposals must be a means of evaluating wetlands to determine the appropriate category for each individual wetland. The Committee is familiar with widely used evaluation methods (WET, HEP, etc.) most of which are technical assessment tools, see Appendix C. We do not believe that any existing evaluation regime is adequate to measure the true value of each function performed by the myriad of types of natural wetlands in the U.S. Consequently, any attempt to evaluate and subsequently categorize natural wetlands with existing methodologies for the purposes of determining those with lesser values, would result in irretrievable harm to the Nation's wetland and wildlife resources. Unfortunately, at the present state of the art, evaluation is still largely subjective based on cursory examination or it requires detailed and costly investigations that attempt to characterize the form and function of an individual wetland system. In too many cases, cursory evaluations are highly dependent upon a few highly regarded functional values, with little avenue for encompassing the sum of the myriad functional values from even a small isolated wetland much less larger and/or multiple wetland units within hydro/bio/geographical units. Consequently, present valuation methods are likely to underestimate the value of even the highest priority wetland and could not hope to produce a realistic value for lesser wetland systems. The latter would likely include smaller systems, isolated/disjunct systems, disturbed or degraded systems, drierend wetlands or transitional zones of wetlands, and ephemeral wetlands. Many of these could have significant but unmeasured functional values.

With a few exceptions, we lack quantitative data on many functions in most important types of natural wetlands. The exceptions (mostly in fresh or salt water marshes) include components of the life support function, i.e., production of avian and mammalian fauna, finfish, shellfish, a few instances of plant products and isolated cases of water purification. For the vast majority of wetlands and even for most different types of wetland, we lack quantitative information even on the biologic productivity, much less adequate, comparable information on other important functional values.

Historically wetlands were grossly undervalued but later, a few waterfowl hunters led efforts to protect and preserve certain types of wetlands. Recently, other life support functions along with hydrologic buffering and water quality improvement, have been identified as significant values. Major segments of society now place high value on wetlands and government policy is to protect rather than destroy our remaining wetlands. A complete reversal in society's valuation of wetlands has occurred in less than 60 years. In fact, the most significant change took place within the last 20 years. Who can estimate the functional values of wetlands to society or society's attitudes, in the 21st century? If valuation schemes are employed to categorize wetlands with certain categories subsequently receiving little or no protection, evaluators must have the ability to estimate future values as well as adequately assess present values of existing wetlands. Lacking an estimate or assumption of future values, evaluators could easily under-rate a significant portion of our existing wetland resources, resulting in the loss of that segment before it has been evaluated

(valued) under the standards of a future society. It does not appear likely that a significant new category of functional value would emerge from future investigations but it would not be surprising to discover additional functions and values or a complete reordering of priorities with further understanding of "low" value wetland systems.

Furthermore evaluation of a wetland is inevitably related to time of year and age of system. Wetlands are dynamic ecosystems undergoing considerable seasonal and annual change as well as progressive change over time, as the wetland system ages. Time, techniques and location of data collection can have substantial impact on the result of a one-time evaluation.

While wetland science is limited in its ability to provide quick and inexpensive methods of quantifying all wetland functions, some means to predict wetland functions are available and being improved. The general functions of wetlands within regions of the U.S. And within local landscapes, i.e., bottomland hardwoods, estuaries, are well known. There is no longer any excuse for development, agricultural, forestry, transportation and other land use programs to fail to use current knowledge and assessment techniques to identify potential consequences of wetland loss with the intent of avoiding wetland and reducing impacts to those that, based on public values, are unavoidable. The Committee concludes that much of the past and current loss of wetlands, and the current controversy in legislative circles, is exacerbated by single-sector, land-use decisions that have not made use of available information on wetland functions and assessment techniques.

Project siting is a critical element in assessment of wetland functions. Placing monetary values on wetlands requires an economic assessment that is sensitive to the land values and economy of the locale within which the project is located. We are aware of the potential costs of assessing the functions of individual wetlands; however, it is also clear that careful and costly study of watersheds is a pre-requisite to designing flood protection programs. Farming practices are guided by professional surveys of regional and individual farm soil conditions. Forest management plans are based on detailed studies of stand composition, volume and growth. Wetlands must be included in similarly comprehensive watershed planning.

To the extent that wetlands are providing important functions in maintaining water quality, reducing flood damage and conserving biological diversity, their management requires an appropriate public investment in data collection and functional assessment. Costs for these efforts can be contained if the functions of wetlands were given due consideration and incorporated in the course of current and future publicly funded flood control, water quality, soil and forest survey and natural heritage programs. Part of the reason that the nation has experienced massive loss of wetlands is that their functions and limitations have been poorly understood by engineers and agricultural land managers.

Those who would develop or drain wetlands search for a simple value system that requires no biological expertise and limited data collection or technical review. The Committee is concerned that some categorization proposals would allow for categorization by non-wetland professionals, i.e., developers or engineers. We do not believe that other disciplines are competent to evaluate wetlands or we an national values and at this stage in the development of the science, we are opposed to those efforts.

The Committee advocates expanded use of planning level assessment by state and federal agencies for the purpose of:

- a. Improving and standardizing application of current knowledge that is applicable to wetland evaluation;
- b. Encouraging a multidisciplinary approach to wetland evaluation;
- c. Encouraging a systems approach to wetland evaluation;
- d. Improving agency consistency in the wetland permit review process, and
- e. Providing advance warning to the regulated community of wetland areas that will require more than a basic level of review.

The Committee is concerned that certain proposals for categorization for regulatory protection purposes do not distinguish among the several functions of wetlands, and lump values, such as flood control and wildlife habitat that have different biological and physical bases, into a few simple "value classes. Schemes to put wetlands into nation-wide value classes without providing for any process to distinguish between regional differences are similarly suspect. In addition, some categorization proposals appear to have a strong element of triage, i.e., if wetlands were assigned to high (Type A), medium (Type B) and low value (Type C) categories, the Committee is concerned that wetlands in the low value category would receive less protection than they currently are provided. Low value wetlands could easily fall under a nationwide permit, allowing development and subsequent loss of these so-called low value wetlands when in fact, their value is largely unknown.

Finally, the Committee recommends that high priority be given to funding research to develop improved techniques and methodologies to quantify the functional values of wetlands and effects of wetland alterations. This research should develop an objective, quantitative, sound evaluation process that can be coupled with the National Wetlands Inventory and should be accomplished by joint private, state and federal action. Similar research is urgently needed to improve inadequate methods to create compensatory wetlands that provide all of the identified wetland functions.

APPENDIX A LEGISLATIVE HISTORY OF WETLANDS PROTECTION IN THE UNITED STATES

Legislation

The Water Pollution Control Act of 1948 (PL 80-845) was the first comprehensive statement of federal interest in clean water programs. PL 80-845 was also the first statute to provide state and local governments with some of the funds needed to solve their water pollution problems.

There were no federally required goals, objectives, limits, or even guidelines. There were no mandatory indicators of whether pollution was indeed occurring. Nevertheless, the U.S. Surgeon General was charged with developing comprehensive programs to eliminate or reduce the pollution of interstate waters.

During the latter half of the 1950's and well into the 1960's, water pollution control programs were shaped by four statutes: the Federal Water Pollution Control Act of 1956 (PL 84-60); the 1961 amendments to that Act (PL 87-88); the Water Quality Act of 1965 (PL 89-234); and the Clean Water Restoration Act of 1966 (PL 89-753). All of these statutes dealt largely with federal assistance to municipal discharges and with federal enforcement programs for all discharges.

Water quality standards become a prominent feature of the law with the passage of PL 89-234, the Water Quality Act of 1965. That law created the Federal Water Pollution Control Administration (FWPCA) and required the development of state water quality standards for interstate waters.

In 1963, Massachusetts enacted a permit-based wetland regulation program, followed by Rhode Island, Connecticut and several other northeastern states.

The Federal Water Pollution Control Act Amendments of 1972—as the Clean Water Act is officially titled—was enacted October 18, 1972. It was the 500th public law passed by the 92nd Congress, hence its short title, PL 92-500. Local, state, and national water quality programs since 1972 have been more firmly shaped by the assumptions in PL 92-500 than by any other law. In more ways than most people realize, Congress changed “business as usual” when it passed PL 92-500. The statute has been amended 12 times since 1972.

The 1972 Federal Water Pollution Control Act Amendments added the section 402 National Pollution Discharge Elimination System (NPDES) permit program, 33 U.S.C. 1344 (1988), to eliminate water quality problems by regulating the discharge of pollutants to the nation’s waters.

The Coastal Zone Management Act of 1972, 16 U.S.C. 1451, (1972), requires applicants to obtain certification from the relevant state coastal resources agency that a permitted activity complies with the state’s coastal zone management program. The state’s program must be approved by the Commerce Department.

The Water Quality Act of 1987, emphasized technology-based standards for industrial dischargers; enhanced enforcement authority with increased civil, criminal, and administrative penalties; and recognized the critical pollution problems of non-point sources.

The federal government has adopted a number of policies aimed at reducing the direct effects of its activities on wetlands. Relevant authorities include the National Environmental Policy Act (NEPA), the Fish and Wildlife Coordination Act, Executive Order 11990 on the Protection of Wetlands, and the Water Resources Development Act of 1986, which includes requirements for mitigation of adverse effects on wetlands. In some coastal areas, the Coastal Barriers Resources Act (CBR), which makes new development projects in designated areas ineligible for most federally financed assistance programs, is also important.

The Tax Reform Act of 1986 eliminated most of the special tax advantages that accrued to farmers and developers for new investments, particularly in wetland areas. The Food Security Act of 1985 included a “swampbuster” provision that makes farmers ineligible for agricultural income-support programs if they convert wetlands and plant commodity crops on them. The Coastal Barriers Resources Act of 1982 withdrew all federal subsidies for development on designated coastal barrier islands and beaches, where wetlands are a critical feature of the environment.

In 1986, the Congress enacted the Emergency Wetlands Resources Act to promote the conservation of our nation’s wetland in order to maintain the public benefits they provide, as well as help fulfill international obligations contained in various migratory bird treaties and conventions. The intent was to protect, manage, and conserve wetlands by intensifying cooperative and acquisition efforts among private interests and local, state, and federal governments.

Regulation

The Clean Water Act (CWA) section 404 permit program regulates the discharge of dredged or fill material into “navigable waters of the United States, which includes adjacent wetlands. 33 U.S.C. 1344 (1972). The program is jointly administered and enforced by the U.S. Army Corps of Engineers (Corps) and the United States Environmental Protection Agency (EPA). The Corps has the primary permit issuance authority. The CWA authorizes the Corps to issue individual and general permits.

The individual permit process under section 404(a) requires the Corps to apply a broad-based “public interest” review test. This test balances a variety of factors ranging from economic to energy considerations. The Corps must also ensure that the permit complies with EPA’s detailed environmental criteria—the section 404(b)(1) guidelines. 40 C.F.R. 230 (1991).

Section 404(b)(1) of the CWA requires the EPA to establish guidelines that specify where and under what conditions dredged or fill material can be discharge lawful. 33 U.S.C. 1344(b)(1). The practical alternatives test is one component of the section 404(b)(1) guidelines.

The practical alternatives test prohibits the discharge of dredged or fill materials to waters of the United States, including wetlands, if there is a “practicable alternative to the proposed discharge that would have less adverse impact on the aquatic

ecosystem, provided that the alternative does not have other, more adverse environmental impacts." 40 C.F.R. 230.10(a) (1991).

Under section 404(c), Congress granted EPA the right to veto Corps permit actions if the discharge would result in "unacceptable" adverse effects on municipal water supplies, shellfish, fishing areas, wildlife or recreation areas.

The second avenue for approval of discharges is authorized by section 404(e). 33 U.S.C. 1344(e) (1972). Here, a proposed discharge may fall under one of thirty-six general permits.

The federal wetland delineation manual is the Corps' primary resource in making wetland determinations. In the 1992 Energy and Water Development Appropriations Act, congress mandated that the Corps use the 1987 manual pending resolution of the proposed changes to the 1989 manual. Pub. L. No. 102-104, 105 Stat. 511 (1991).

MOAs/Executives Orders

Memorandum of Agreement (MOA) Between the Department of Army and the Environmental Protection Agency Concerning Federal Enforcement for the section 404 program of the Clean Water Act (Jan. 19, 1989) (1989). Under this accord, the Corps retains primary responsibility for matters of jurisdiction, that is, determining whether wetland regulations apply.

The 1990 Memorandum of Agreement (MOA) on mitigation between the Army Corps of Engineers (Corps) and the Environmental Protection Agency (EPA) provided new guidance for wetland mitigation 55 Fed. Reg. 9210 (1990).

The MOA is the first joint guidance issued. It is used by the Corps and EPA to determine the type and level of mitigation necessary for compliance with the guidelines.

The MOA gives wetland a higher priority than other aquatic areas. The Corps agreed that, as to wetland, it will seek to achieve a goal of no overall net loss of values and functions.

In one of the most significant sections of the MOA, it adopted the Council on Environmental Quality's (CEQ) definition of mitigation, 40 C.F.R. 1508.20 (1991), which is avoiding, minimizing, and rectifying impacts; reducing impacts over time, and compensating for impacts, summarized in the MOA as avoidance, minimization, and compensatory mitigation. The MOA then went further than CEQ by requiring that mitigation measures be applied in the sequence set forth in the CEQ regulation.

Executive Order No. 11990, titled, "Protection of Wetlands," although not applying to private work done under federal permit with no federal funding or assistance, does direct that each agency shall take action "to minimize the destruction, loss or degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands." It further directs that work conducted or funded by a federal agency shall "to the extent permitted by law avoid undertaking or providing assistance for new construction located in wetlands unless "there is no practicable alternative to such construction" and "the proposed action includes all practicable measures to minimize harm to wetlands.

Executive Order No. 11988, dealing with protection of floodplains, similarly requires written agency justification for a project proposed to be located in a floodplain; a statement indicating whether the action conforms to applicable state or local floodplain protection standards; and a list of alternatives considered. Unlike Executive Order No. 11990, this one reaches federal permit issuance as well as other federal activities.

Agency Policies

EPA

Section 404 authorizes a special permit program to control dredge and fill operations. It makes the Secretary of the Army responsible for issuing such permits. But the Secretary and the EPA Administrator are jointly responsible for setting the guidelines by which permits are to be judged.

EPA's guidelines are often considered the driving force in the Corps permit process. These guidelines, which were issued in 1980, state that "no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem" 40 C.F.R. 230.10(a) (1980). EPA is involved in the 404 permit program in other important ways, too. For example, EPA controls what areas can be listed as suitable disposal sites and can prohibit certain materials from being discharged at an approved site on certain grounds. Permits issued under section 404 expire at the end of five years.

The land use control trend becomes apparent particularly when reviewing EPA decisions made pursuant to its section 404(c) authority. To substantiate a veto under section 404(c), 33 U.S.C. 1344(c) (1988), EPA must find unacceptable adverse effects on municipal water supplies, shellfish beds and fishery areas, wildlife, or recreational areas.

EPA first published rules implementing section 404(c) on October 9, 1979—some seven years after passage of the Act. These rules included reference to a prior set of section 404(b)(1) guidelines, which EPA said set forth not only the criteria for permit issuance by the Corps, but also “the substantive criteria by which the acceptability of a proposed discharge is to be judged for purposes of section 404(c). 44 Fed. Reg. 58,076 (1979). Late the following year, EPA published new section 404(b)(1) guidelines without amending its section 404(c) regulations. 45 Fed. Reg. 85,336 (Dec. 24, 1980).

EPA has since interpreted section 404(c) and these guidelines to provide a single environmental imperative which is applied only after the Corps’ “public interest” review has determined that the project is on balance, socially beneficial.

Under section 309 a of the CWA, the EPA is empowered to issue administrative orders in response to wetland violations. 33 U.S.C. 1319(a) (1986).

Department of Interior

FWS

The Fish & Wildlife Service recognizes the definition of mitigation provided by the Council of Environmental Quality that includes a logical sequence of steps: (1) avoiding the impact, (2) minimizing the impact, (3) rectifying the impact, (4) reducing or eliminating the impact over time, and (5) compensating for the impact as a last resort action. Further, the Service’s mitigation policy established a concept of Resource Categories with designation criteria for each category, and mitigation goals for each category.

COE

The Act gives the Corps permitting authority under section 404(a), 33 U.S.C. 1344(a) (1988); with the obligation to consider the criteria promulgated by EPA pursuant to section 404(b), 33 U.S.C. 1344(b) (1988).

To comply with the court ruling in *NRDS v. Callaway*, the Corps expanded the jurisdictional reach of the section 404 program from the traditional concept of navigable waters to one consistent with other CWA programs.

Department of Agriculture

SCS

The Soil Conservation Service is charged with delineating wetland under the swampbuster provision of the Farm Act. They use the 1987 Wetlands Delineation Manual during this process.

Department of Transportation

The Federal Highway Administration funded the development of the Wetland Evaluation Technique (WET) in 1982-83. This technique has since been refined and reissued by the U.S. Army Corps of Engineers (WET II).

State Protection

As detailed above, state wetland relations date from the Massachusetts legislation of 1963. Today, all coastal states have some form of regulation over alteration of marine wetlands, and 14 states have a freshwater wetland regulatory program.

Congressional response to the lack of success under section 208 resulted in the addition of section 319, the Nonpoint Source Management Program, in 1987.

Under section 319, EPA funding grants encourage the states to voluntarily opt into the federal program. The states may identify and inventory nonpoint source problems affecting their waters, prioritize and develop strategies for addressing them, but no federal permit program is created under section 319.

CWA section 401(a) certification requirement is a power tool for state participation in CWA section 404 federal permitting of dredge and fill activities in wetland. The section 401(a) certification requirement is designed to insure that projects requiring a federal permit comply with certain CWA requirements including state water quality standards.

Few states have promulgated water quality criteria for wetlands. EPA as recommended that states develop water quality criteria for wetlands by using a two-phase approach. Phase I involves development of water quality standards for wetlands

based upon existing information. EPA expects the states to accomplish phase I by the end of fiscal year 1993. Phase II involves further refinement of the water quality standards using new science and program developments.

Currently, about 10 states utilize some form of classification system in their regulation of activities affecting wetland.

Under section 401 of the CWA, 33 U.S.C. 1341 (1988), and section 307(c)(3) of the Coastal Zone Management Act (CZMA), 16 U.S.C. 1456(c)(3) (1988), Congress has provided every state ample authority to "veto," or to impose virtually any condition it wants, in every federal section 404 permit and almost every federal permit under section 10 of the Rivers and Harbors Act (RHA).

Proposed Legislation

In October 1990, the Comprehensive Wetlands Conservation and Management Act of 1990 (H.R. 5968) was introduced. The bill, reintroduced as H.R. 1330 on March 7, 1991, would substantially modify the section 404 wetland permit process by establishing a federal wetland classification program.

Other bills regarding wetland classification and/or protection have been introduced into the House to moderate or offset the thrust of H.R. 1330, for example the Wetlands No Net Loss Act of 1991, H.R. 251, and the Wetlands Protection and Regulation Reform Act of 1991, H.R. 404.

Two bills have been introduced into the House of Representatives this year, H.R. 350 and H.R. 1330. Both bills address amendments to section 404 of the CWA.

APPENDIX B NORTH DAKOTA'S NO NET LOSS OF WETLANDS LAW

North Dakota is located in the 300,000 sq. mi. Area known as the Prairie Pothole Region, and it produces one-half of the ducks produced in the lower 48 states in an average water year. Prairie wetlands exist in complexes of various types that are most easily defined by the degree of permanency of water. Of the estimated original 3 million acres of prairie wetland in the state, about 2 million acres remain.

In 1987, the North Dakota Legislature passed a law commonly referred to as the No-Net-Loss of Wetlands (NNLW) law. The final bill that was passed by the legislature was the result of intense negotiations between water development and wildlife interests in the State, where tradeoffs were made on both sides. Historically, wetland laws in North Dakota were permissive to the point of encouraging wetland drainage for agricultural purposes. Thus, the NNLW law was designed as a means of restricting wetland drainage to reduce the average annual loss of 20,000 acres per year. This law is by far the most significant piece of legislation affecting North Dakota's wetland ever passed by the State Legislature, and includes a policy which states, in part, "the legislative assembly therefore concludes that wetlands should be protected and preserved".

More recently, the law has been closely scrutinized and criticized for being a "wetland mitigation bank" with serious flaws by some conservation interests, yet attempts have been repeatedly made to repeal the law by pro-drainage interests saying the law is too restrictive. The origin intent of the North Dakota law was to restrict and restrain wetland destruction. The law, as most true compromises, has areas which can be improved.

To accomplish NNLW, North Dakota law requires acre-for-acre replacement of all wetlands drained under permits authorized by the state. A state permit is required for all wetlands with a drainage area of 80 acres or more (note that is drainage area, not wetland acres). A statewide wetland banking system is used to track wetland losses and replacements within four biogeographical units (biotic areas) and individual counties. Only the acreage of restored and created wetland with "material wildlife values" as determined by the North Dakota Game and Fish Department are credited to the bank as replacement wetland. This system is used to target replacements so that at least 50 percent of the lost acreage is replaced in the same biotic area. The law ensures that statewide wetland losses do not exceed replacements by more than 2500 acres at any one time, and the banking system is divided into temporary and permanent replacements. Only permanent replacements are allowed to be credited against drainage acres in the bank.

A party draining a wetland under a state drainage permit may replace an equal wetland acreage at entirely their own expense or by using replacement credits in the wetland bank with payment of 10 percent of the replacement cost. Replacement costs are calculated by adding the average land value in the biotic area and the estimated construction costs to replace that acreage. The wetland bank cannot be used if replacements are not available. There is no direct requirement to replace wetlands which do not require a state drainage permit (less than 80 acre watershed),

but those acres are registered as losses (debits) in the bank and reduce the available replacement acres (credits) in the area of drainage.

North Dakota enacted the nation's first no net loss of wetlands legislation in 1987. The concept embodied in this legislation, and the actual nuts and bolts of the system, may do more to protect wetlands, and guarantee the existence of a non-decreasing wetland base, than any other regulatory approach could possibly hope to achieve. In fact, the widely accepted Fish and Wildlife estimate of 20,000 acres of wetland lost per year has been eliminated, and the wetland bank currently shows a net increase of approximately 500 acres. Swampbuster is probably the main reason for halting the wetland drainage, but over the long-term, it is the no net loss program which will maintain the existing wetland base.

Unlike other regulatory programs, North Dakota's no net loss incorporates flexibility, management and balance. The key points of the program include:

1. *Wetland Policy.* This is essential, as it is opinions and attitudes which determine the support and actions of landowners.
 2. *Drain Permit.* Only those wetlands with a watershed area of 80 acres or more require a state permit.
 3. *Wetlands Bank.* All wetlands, regardless of size, are counted as debits in the bank if drained, and credits in the bank if restored or created (created wetland must have material wildlife values).
 4. *Replacement Requirements.* All wetlands drained must be replaced with an equal acreage of replacement wetland. If a wetland has a watershed area of more than 80 acres, it must be replaced by the sponsor or landowner, using one of three options:
 - a. Replacement on-farm
 - b. Replacement off-farm arranged by the project sponsor
 - c. Replacement off-farm through application to the wetland bank.
 5. *Replacement Costs.* The project sponsor, whether individual landowners or other wise, is required to pay only 10% of the replacement costs if replacement is satisfied through wetland bank.
 6. *Debit Limits.* The wetland bank cannot carry any more than 2500 acres as debit.
 7. *Wetland Replacement Acquisition.* This must come from willing sellers, and cannot interfere with natural waterways or artificial channels.
 8. *Replacement Tax Payments.* This law requires that land placed into federal ownership to meet replacement requirements must not diminish tax payments to local governments. Full replacement tax payments must be made.
 9. *Wetlands Bank.* The wetland bank, for record purposes, is divided into four accounts:
 - a. Government agency account
 - b. Surface coal mining account
 - c. Temporary account
 - d. Permanent account. This account is for permanent credits and debits which comprise the true, usable bank balance.
 10. *Location of Replacement Wetlands.* The replacement of wetland must come from the following areas:
 - a. Same or surrounding counties—50%
 - b. Statewide—50%
 - c. If not available from same county or surrounding counties, replacement wetland can come from same biotic area
 11. *Administration.* The no net loss program is jointly administered by the State Engineer and the Game and Fish Director, to guarantee an equal balance of management and decisionmaking. All permits must have joint approval.
 12. *Flexibility and Management.* The no net loss program requires that the existing wetland base be maintained, but allows flexibility and management.
- The North Dakota no net loss of wetlands law, being the first ever developed, is certainly subject to improvement and refinement. The results achieved to date are remarkable. The support and approval of the state (Governor and State agencies) and local governments cannot be under-estimated for those who are seriously interested in protecting wetlands.
- When these laws were developed, it was recognized that acre-for-acre replacement is a less than perfect method for conserving wetlands because it risks the loss of wetland values. An ecological equivalency method of replacement is obviously an ideal, though may be impossible due to lack of knowledge in some areas of wetland functions. It was also recognized, however, that a value based system such as in-

kind replacement on a project-by-project basis would place unworkable demands on state agencies and individuals, and inherently lacks the flexibility to be acceptable and workable to North Dakota. There may also be an under-reporting occurring of wetlands that have a watershed less than 80 acres that don't require a permit, but may be placed as a debit in the bank. Also, a recent review by the Corps of Engineers of the North Dakota wetland bank found that replacement credits weren't occurring in the biotic area of loss as desired.

Another topic of concern is that state and federal agency wetland restorations, as required by state law, are recorded as credits in the wetland bank. Some people conclude that state and federal agencies are restoring wetland in order to facilitate wetland drainage in other areas. A true mitigation bank would require those needing the mitigation credits to pay for them in entirety.

In summary, the no-net-loss of wetlands law for North Dakota was heralded by many conservation interests as a landmark in wetland protection for the state. Proponents of this legislation point out that the law needs refinement and improvement over time, but believe that this type of system can lead to balanced water management in prairie states.

OPERATION OF THE NORTH DAKOTA WETLANDS BANK

The Wetlands Bank in its most limited definition is simply the accounting system that records acreages of wetlands drained and wetlands created in North Dakota, pursuant to Chapter 61, NDCC. The accounting system maintains a net balance of wetland acres for each county, within contiguous counties, within each of the four biotic areas of the state, and statewide.

Operation of the Wetlands Bank is governed by a number of definitions and rules relative to how wetland acreages are determined, what is credited and what is debited, how the cost of replacement acreages are determined, and other functions necessary to maintain these wetland acreage accounts.

In operation, the Wetlands Bank is actually the system which performs the many functions necessary to monitor wetland drainage and replacements and ensures that there is essentially no net loss of wetland acres within North Dakota by maintaining a net balance above the established 2,500 acre deficit limit. By monitoring wetland acreage changes within individual counties, contiguous counties, and biotic areas, the Wetlands Bank also serves to target replacement efforts and ensure that 50 percent of the replacement acreage is located in the area of drainage.

Because of the nearly infinite variety of wetland drainage and replacement projects which the Bank must handle, the operational rules must be flexibly interpreted and applied. Judgments and determinations necessary to implement these rules and operate the Bank are jointly made by the state engineer and the Game and Fish Director. An interagency evaluation team comprised of one person from the state engineer's office and one from the North Dakota Game and Fish Department handle day-to-day debiting and crediting operations. If the team cannot reach agreement, then the state engineer and Director directly resolve the matter.

Credits to the Bank are made for all acreages of restored wetland and for acreages of manmade wetland that are determined by the commissioner and state engineer to have "material wildlife values". Guidelines for determining whether a man-made wetland has (or will have) material wildlife value requires the evaluation team to consider soil types, water depth and permanence, adjacent land use, the likelihood that desirable wetland vegetation will become established, the potential for wildlife use, and other factors pertinent to the wetland under consideration. In essence, the determination is the evaluation team's judgment that the man-made wetland will provide habitat comparable to a natural wetland in good condition. The evaluation team may determine that only a portion of a man-made wetland has material wildlife value and limit credits to that acreage.

Debits are made for all wetland acres drained. Although only drainage of wetlands with 80 acres or greater watersheds requires a state permit and is, therefore, easily tracked and accounted in the Bank, drainage of smaller wetlands is also subject to debiting.

Exceptions to the above credit and debit rules are made for wetlands replaced as required mitigation for federal projects, wetlands involved in active mining operations, and wetlands that are or may be only temporarily restored such as those under the Conservation Reserve Program. Separate accounts are kept for wetlands involved in mining operations and temporary restoration programs. These accounts will be reconciled and incorporated into the permanent banking system upon completion of the mining operation or a finalization of temporary wetland restoration programs.

The acreage of any wetlands which are drained or created is determined by the spring water level in years with typical amounts and rates of runoff during periods judged to be of normal precipitation. Aerial photographs, meteorological data, soil surveys National Wetland Inventory maps, and watershed size, wetland basin size and watershed yield calculations, plus any other enlightening information may be used to arrive at the most accurate acreage determination possible.

Under North Dakota wetlands law, only projects that either store more than 12½ acre feet of water or drain wetland with greater than 80 acre watersheds require permits from the state engineer. All wetland drainage and wetland creations are, however, eligible for debiting and crediting to the Wetlands Bank. An additional function of the wetlands banking system is, therefore, to coordinate directly with the many public and private entities involved in small wetland projects to create a timely and efficient reporting network that allows debiting and crediting of unpermitted wetland drainage and development.

In both debiting and crediting operations, the state engineer's office assumes primary responsibility for developing technical information on water volumes, acreages, and depths. The Game and Fish Department is principally responsible for identifying the ecological limits of wetland and determining acreages with material wildlife values. With experience, members of the interagency evaluation team become well acquainted with technical aspects of determinations made by both agencies and the basis for judgments made by each. This results in some ability for critical review, productive discussion, and problem resolution by the team beyond what may be initially apparent.

Day to day operation of the Wetland Bank can perhaps be better understood by considering typical credit and debit situations and the major complexities associated with each.

Wetland Credits:

In credit determinations, the major challenge for the evaluation team is to agree on the size of the wetland that will be created and the acreage of the created wetland that will have material wildlife value. In other words, to determine the size of the credit that should be made to the Bank.

For projects requiring permits, the application received by the state engineer generally contains sufficient information relative to watershed and basic characteristics, the proposed water retention structure, and any proposed operational features or water management purposes so that the size and general characteristics of the wetland to be created can be reasonably determined. If all regulatory requirements external to the Wetlands Bank are met, a permit to construct is issued and all available project information is submitted to the interagency evaluation team's representative at the state engineer's office. Information relative to credit projects that do not require permits is submitted directly to the evaluation team at the state engineer's office.

A preliminary determination as to the amount of credit is made by the state engineer's office, a standardized wetland evaluation form is completed and this form along with other relevant project and watershed information is forwarded to the North Dakota Game and Fish Department of review and concurrence. If there is disagreement, the evaluation team representatives meet and attempt to resolve differences.

Upon agreement of both agencies, the Wetlands Bank evaluation form is signed, the credit acreage is entered into the proper account, and copies of the evaluation form are permanently filed at the state engineer's office.

Projects that attempt to restore natural wetland at or near their original water level through a simple ditch block are the most common credit project and are generally quite easy to agree on. Projects that involve increasing the size of an existing natural wetland and those which utilize mechanical structures to partially restore a basin or manipulate water levels for wetland enhancement or other water management purposes are more problematic. Determining a proper credit acreage for such projects is done case-by-case and often involves professional judgment to reach "best guess as to the acreage that has material wildlife value and will be credited to the Bank.

Cases involving credits for man-made wetland are so variable that it is difficult to discuss a typical situation. Varying from easily evaluated small, shallow dams and stock ponds to very complex, large multipurpose reservoirs, each project must be considered separately, if not uniquely, by the evaluation team. Thus far few rules for crediting man-made projects have been developed. In general, full acreage credit is given for most small (less than 5 acres), shallow (less than 6' maximum water depth) man-made wetland that meet other regulatory guidelines for determining

material wildlife value. For larger impoundments, only acreages covered by water less than 3 feet deep are considered for credit; again, pending application of other regulatory guidelines for determining material wildlife value.

Undoubtedly, with more experience, additional methods, and guidelines for crediting manmade wetland will be established. For the present, the evaluation team is very conservatively crediting man-made wetland to attempt to give credit for only those acreages which clearly provide material wildlife values.

Wetland Debits:

Debits to the Bank are similarly processed, but generally less problematic. In the case of debits, the team must first reach agreement on the acreage to be drained and then check the statewide account to determine whether or not the 2,500 acre debit limit will be exceeded. If the debit limit would be exceeded, a drainage permit cannot be issued and no debit is made. Projects not requiring permits are not subject to the 2,500 acre limit, but are debited to appropriate accounts.

In order to debit the Bank, the party proposing the drainage must agree to pay 10 percent of the cost of replacement. A final function of the debiting operations of the Wetlands Bank is, therefore, to determine wetland replacement costs.

Wetland replacement costs are annually determined for each of the four biotic areas. These costs are a composite of the average land value in each biotic area plus a statewide average construction cost for wetland restoration projects. These per acre costs are jointly determined by the commissioner and state engineer based on land values annually published by North Dakota State University and actual construction costs obtained from the U.S. Fish and Wildlife Service, Ducks Unlimited, and others involved in wetland restorations and developments.

Although debits are generally less problematic to process, determination of the acreage of a wetland to be drained is not always as simple as it may sound and certainly not immune from debate or external criticism. The potential for disagreement over debit wetland acreage determinations arises largely because of the 10 percent replacement cost-share that is required of the party desiring to drain. This cost is a per acre figure within each biotic area of the state and so obviously the larger the debit determination (wetland size), the greater the amount payable. The highly variable and often difficult to determine boundaries of many wetlands offers considerable room for debate and criticism. As outlined in Section 81-02-03-11 of the drainage rules, the evaluation team is required to consider virtually all available information in determining wetland acreages. The final determination may be arrived at as a compromise or "best guess" of the team.

APPENDIX C HABITAT EVALUATION TECHNIQUES

Several approaches to wetland evaluation for various community functions are in use, the Habitat Evaluation Procedure (HEP) of the Fish & Wildlife Service, the Corps of Engineer's Wetland Evaluation Technique (WET), and a less widely known, community-oriented, Guild Matrix Analysis (GMA). The three differ markedly in approach and merits. Although all include habitat assessment, they do so in quite different levels and for different reasons. Accuracy of all systems is reduced by minimal data bases, but different goals may be more important than precision.

The Habitat Evaluation Procedure (HEP) is wildlife species-oriented (Flood et al. 1977), although several species have been pooled in some studies to provide an assemblage or community-level treatment. The key feature of this analysis is the Habitat Suitability Index (HSI with a maximum value of 1.0) based on the best-available-data on habitat use by a particular species. This index is calculated for a specific area and is multiplied by acreage to produce Habitat Units (HU). The logic of the calculation is that habitat lost or replaced should be estimated on the basis of quality rather than acreage. Thus, the technique can be applied to two areas for current comparison or to a before-and-after setting to measure loss (as in habitat damage) or improvement (as in restoration projects). It is limited by the fact that HSI models are not available for all species or areas, and often are based on few variables and minimal data.

WET is a broader system used to estimate all wetland functions, using a rating of high, moderate or low, and including functions such as hydrology, water purification, food production and export, fish and wildlife habitat, and values such as esthetic, historic and passive recreation (Adamus, et al. 1987). A major advantage is that of a landscape approach which considers topography, wetland connectivity, and other geomorphic parameters. Although WET uses waterfowl and waders as biological indicators, groups rather than species are assessed, and habitat associations are

not very specific. Moreover, rare species are immediate "red flags" that outweigh other considerations.

Partly a an outgrowth of attempting to broaden HEP to assemblages or communities rather than species, Short & Burnham (1982) devised a guild analysis using a resource matrix for bird species. As a community or habitat-oriented approach, GMA allows assessment at various scales, and attempts to assess habitat resource availability in relation to behavioral characteristics of the guilds that limit them to certain habitats. The overall advantage is that it deals with large- and mid-scale issues using simple measures like presence and absence, meaning that general information can be used when detailed data are not available. Additionally, the scale can be modified to more detailed habitat units or by species selection, but the focus remains on availability of habitat resources such as food, nest-sites, rest areas, etc. for a guild of species rather than on detailed knowledge of a single species or taxonomic group banking), or to assess quality of a replacement wetland. Greater precision is required to measure enhancements than to measure restoration success (because they tend to improve habitat less dramatically than those actions that start from near-zero), which itself is more demanding than measuring the success of wetland creation. Hence, different goals demand different levels of precision.

103D CONGRESS
1ST SESSION

S. 1304

To amend the Federal Water Pollution Control Act to improve the conservation of wetlands and thereby restore and maintain the physical, chemical, and biological integrity of the Nation's waters, and for other purposes.

IN THE SENATE OF THE UNITED STATES

JULY 28 (legislative day, JUNE 30), 1993

Mr. BAUCUS (for himself and Mr. CHAFEE) introduced the following bill; which was read twice and referred to the Committee on Environment and Public Works

A BILL

To amend the Federal Water Pollution Control Act to improve the conservation of wetlands and thereby restore and maintain the physical, chemical, and biological integrity of the Nation's waters, and for other purposes.

1 *Be it enacted by the Senate and House of Representa-*
2 *tives of the United States of America in Congress assembled,*

3 **SECTION 1. SHORT TITLE.**

4 This Act may be cited as the "Wetlands Conservation
5 and Regulatory Improvements Act".

1 **SEC. 2. AMENDMENT OF FEDERAL WATER POLLUTION CON-**
2 **TROL ACT.**

3 Except as otherwise expressly provided, whenever in
4 this Act an amendment or repeal is expressed in terms
5 of an amendment to, or repeal of, a section or other provi-
6 sion, the reference shall be considered to be made to a
7 section or other provision of the Federal Water Pollution
8 Control Act (33 U.S.C. 1251 et seq.).

9 **SEC. 3. DECLARATION OF POLICIES AND GOALS.**

10 Section 101(a) (33 U.S.C. 1251(a)) is amended—

11 (1) by striking “and” at the end of paragraph
12 (6);

13 (2) by striking the period at the end of para-
14 graph (7) and inserting “and”; and

15 (3) by adding at the end the following:

16 “(8) it is the national policy to achieve, through
17 regulatory and nonregulatory strategies involving all
18 levels of government—

19 “(A) the restoration of wetlands to in-
20 crease the quality and quantity of the wetlands
21 resource base of the United States; and

22 “(B) no overall net loss of the remaining
23 wetlands resource base of the United States.”.

24 **SEC. 4. DEFINITION AND DELINEATION OF WETLANDS.**

25 (a) **DEFINITIONS.**—Section 502 (33 U.S.C. 1362) is
26 amended—

1 (1) in paragraph (7) by inserting “, including
2 wetlands” immediately before the period; and

3 (2) by adding at the end the following new
4 paragraph:

5 “(21) The term ‘wetlands’ means those areas that
6 are inundated or saturated by surface water or
7 ground water at a frequency and duration sufficient
8 to support, and that under normal circumstances do
9 support, a prevalence of vegetation typically adapted
10 to life in saturated soil conditions. Wetlands gen-
11 erally include swamps, marshes, bogs, fens, potholes,
12 playa lakes, vernal pools, and similar areas.”.

13 (b) DELINEATION OF WETLANDS.—

14 (1) REVISIONS TO DELINEATION PROCE-
15 DURES.—After the date of enactment of this Act, no
16 revisions to or clarifications of the guidelines for
17 identifying and delineating wetlands areas under sec-
18 tion 404(a) of the Federal Water Pollution Control
19 Act (33 U.S.C. 1344(a)), as amended by this Act,
20 shall be issued until the National Academy of
21 Sciences has completed the study of wetlands au-
22 thorized by Public Law 102-389.

23 (2) CONTINUED USE OF 1987 MANUAL.—Until
24 the guidelines for identifying and delineating wet-
25 lands areas are issued pursuant to section 404(a) of

1 the Federal Water Pollution Control Act (33 U.S.C.
2 1344(a)), as amended by this Act, the Secretary of
3 the Army, acting through the Chief of Engineers,
4 and the Administrator of the Environmental Protec-
5 tion Agency shall use the January 1987, "Corps of
6 Engineers wetlands delineation manual" and imple-
7 menting guidelines to identify and delineate such
8 wetlands areas.

9 (3) DELINEATION GUIDELINES.—Section
10 404(a) (33 U.S.C. 1344(a)) is amended by inserting
11 "(1)" after "(a)" and by adding the following new
12 paragraph:

13 "(2) The Administrator in conjunction with the
14 Secretary, the Secretary of Agriculture and the Sec-
15 retary of the Interior shall, after field testing and
16 notice and opportunity for public review and com-
17 ment, issue guidelines to identify and delineate wet-
18 lands areas. The guidelines shall—

19 "(A) be developed in consultation with the
20 States;

21 "(B) be based on the best available sci-
22 entific information; and

23 "(C) take into account regional variations
24 in hydrology, soils, and vegetation."

1 (4) DELINEATION TRAINING, CERTIFICATION
2 AND OUTREACH.—

3 (A) TRAINING OF WETLANDS DELINEA-
4 TORS.—The Secretary of the Army, acting
5 through the Chief of Engineers, and the Admin-
6 istrator of the Environmental Protection Agen-
7 cy shall, in consultation with the Coordinating
8 Committee establish under section 323 of the
9 Federal Water Pollution Control Act, as amend-
10 ed by this Act, develop materials and conduct
11 training courses for consultants and State and
12 local governments to explain the guidelines for
13 identifying and delineating wetlands areas pur-
14 suant to section 404(a) of the Federal Water
15 Pollution Control Act (33 U.S.C. 1344(a)), as
16 amended by this Act.

17 (B) FUNDING FOR TRAINING AND CERTIFI-
18 CATION PROGRAM.—Of amounts appropriated
19 for each fiscal year beginning after the date of
20 the enactment of this Act for administration of
21 section 404 of the Federal Water Pollution
22 Control Act (33 U.S.C. 1344) by the Corps of
23 Engineers, the Secretary of the Army, with the
24 Administrator, shall use such amounts as are
25 practicable to carry out the Corps of Engineers

1 Program for interagency wetlands delineation
2 training and the program for training and cer-
3 tification of Federal employees and other indi-
4 viduals as wetlands delineators authorized by
5 section 307(e) of the Water Resources Develop-
6 ment Act of 1990 (Public Law 101-640).

7 (5) ASSISTING SMALL LANDOWNERS WITH WET-
8 LANDS DELINEATION.—

9 (A) IN GENERAL.—Of amounts appro-
10 priated for each fiscal year beginning after the
11 date of enactment of this Act for administration
12 of section 404 of the Federal Water Pollution
13 Control Act (33 U.S.C. 1344), the Secretary of
14 the Army, acting through the Chief of Engi-
15 neers, and the Administrator of the Environ-
16 mental Protection Agency shall use such
17 amounts as are necessary, but not to exceed a
18 combined total of \$5,000,000, to assist private
19 landowners who lack the financial capacity to
20 identify or delineate wetlands in order to apply
21 for permits under that section or to avoid im-
22 pacts to wetlands.

23 (B) FORM OF ASSISTANCE.—The assist-
24 ance under subparagraph (A) shall be provided
25 in cooperation with the Director of the United

1 States Fish and Wildlife Service and the Chief
2 of the Soil Conservation Service and shall
3 include—

4 (i) the delineation of wetlands bound-
5 aries within ninety days of a request for
6 such delineation to the maximum extent
7 practicable; and

8 (ii) technical assistance to owners of
9 wetlands in the preparation of wetlands
10 management plans for their lands to pro-
11 tect and restore wetlands and meet other
12 goals of the Federal Water Pollution Con-
13 trol Act, including protection and propaga-
14 tion of fish, shellfish, and wildlife, control
15 of nonpoint and point sources of pollution,
16 prevention and reduction of erosion, and
17 protection of estuaries and lakes.

18 (C) REGULATIONS.—Within one hundred
19 and eighty days after the date of enactment of
20 this Act, the Secretary and the Administrator
21 shall issue regulations defining the scope of
22 technical assistance and which landowners are
23 eligible for assistance under this paragraph.

24 (6) EDUCATION AND INFORMATION.—The Sec-
25 retary of the Army, acting through the Chief of En-

1 gineers, and the Administrator of the Environmental
2 Protection Agency shall, in cooperation with the Co-
3 ordinating Committee established under section 323
4 of the Federal Water Pollution Control Act (as
5 amended by this Act), prepare, update on a biannual
6 basis, and make available to the public for purchase
7 at cost—

8 (A) an indexed publication containing all
9 Federal regulations, general permits, and regu-
10 latory guidance letters relevant to the permit-
11 ting of activities pursuant to section 404 of the
12 Federal Water Pollution Control Act (33 U.S.C.
13 1344); and

14 (B) information to enable the general pub-
15 lic to understand the delineation of wetlands,
16 section 404 permitting requirements, wetlands
17 restoration, and other matters considered rel-
18 evant.

19 **SEC. 5. REGULATION OF ACTIVITIES.**

20 (a) **DEFINITION OF FILL MATERIAL.—**

21 (1) Section 404(d) (33 U.S.C. 1344(d)) is
22 amended—

23 (A) by inserting “(1)” after “(d)”; and

24 (B) by adding at the end the following:

1 “(2) The term ‘fill material’ as used in this
2 section means any material that has the effect
3 of replacing portions of navigable waters or
4 changing the bottom elevation or configuration
5 of a water body.”.

6 (2) Section 502(6) (33 U.S.C. 1362(6)) is
7 amended by inserting “fill material, dirt,” after
8 “dredged spoil,”.

9 (b) DEFINITION OF DISCHARGE OF DREDGED OR
10 FILL MATERIAL.—Section 404(d) (33 U.S.C. 1344(d)),
11 as amended by this Act, is amended by adding at the end
12 the following:

13 “(3) The term ‘discharge of dredged or fill ma-
14 terial’ means any addition of dredged or fill material
15 into navigable waters and includes, without limita-
16 tion, any addition or redeposit of dredged or fill ma-
17 terials, including excavated materials, into the navi-
18 gable waters which is incidental to any activity, in-
19 cluding draining, mechanized landclearing, ditching,
20 channelization, or other excavation that has or would
21 have the effect of destroying or degrading any area
22 of navigable waters.”.

1 SEC. 6. PERMIT PROCESSING IMPROVEMENTS.

2 (a) PERMIT DECISION DEADLINES.—Section 404(a)
3 (33 U.S.C. 1344(a)), as amended by this Act, is amended
4 by adding the following new paragraphs:

5 “(3) Except as provided in paragraph (4), a de-
6 cision with respect to an application for a permit
7 under paragraph (1) shall be made not later than
8 the ninetieth day after the date the notice of such
9 application is published under paragraph (1).

10 “(4) The Secretary’s decision with respect to an
11 application for a permit under paragraph (1) may be
12 made after the ninetieth day referred to in para-
13 graph (3), only if—

14 “(A) with respect to issuance of the per-
15 mit, the Secretary is required under the Na-
16 tional Environmental Policy Act of 1969, as
17 amended, to issue an environmental impact
18 statement, in which case the decision shall be
19 made within thirty days of date on which the
20 requirements of that Act are met;

21 “(B) the permit application involves an ac-
22 tivity that may affect any species that is listed
23 or any critical habitat that is designated under
24 the Endangered Species Act of 1973, as amend-
25 ed, in which case the decision shall be made

1 within thirty days of the date on which the re-
2 quirements of that Act are met;

3 “(C) the Administrator, the Secretaries of
4 the Departments of Agriculture, the Interior,
5 Commerce, or Transportation, the head of an-
6 other appropriate Federal agency, or the Gov-
7 ernor of the State in which the activity occurs
8 requests that the decision be made after such
9 day, in which case the decision shall be made
10 not later than the one hundred and fiftieth day
11 after the date the notice of application is pub-
12 lished under paragraph (1);

13 “(D) the Secretary and the permit appli-
14 cant determine that additional time is needed to
15 evaluate such application; or

16 “(E) the decision is precluded as a matter
17 of law or procedures required by law.”.

18 (b) DEADLINES ON PROHIBITION OR RESTRICTION
19 OF ACTIVITIES BY ADMINISTRATOR.—Section 404(c) (33
20 U.S.C. 1344(c)) is amended by adding at the end the fol-
21 lowing new sentence: “The Administrator shall make any
22 determination under this subsection to prohibit or restrict
23 any discharge into navigable waters resulting from an ac-
24 tivity for which a permit may be issued under subsection
25 (a) not later than the one hundred and eightieth day after

1 the date of decision with respect to an application for such
2 a permit under subsection (a).”.

3 (c) ADMINISTRATIVE APPEAL OF PERMIT DECISIONS.—
4

5 (1) IN GENERAL.—Section 404(a) (33 U.S.C.
6 1344(a)), as amended by this Act, is amended by
7 adding at the end the following new paragraph:

8 “(5) The Secretary shall, after notice and an
9 opportunity for public comment, issue rules estab-
10 lishing procedures under which—

11 “(A) an applicant for a permit under para-
12 graph (1) or any person who participated in the
13 public comment process regarding such permit
14 application may appeal a decision under this
15 subsection with respect to such a permit; and

16 “(B) an appeal shall be heard and decided
17 by an official other than the person who made
18 the decision with respect to such a permit.”.

19 (2) DEADLINE FOR ISSUANCE OF RULES.—The
20 Secretary shall issue rules under section 404(a)(5)
21 (33 U.S.C. 1344(a)(5)), as amended by this Act, by
22 not later than one hundred eighty days after the
23 date of the enactment of this Act.

1 **SEC 7. GENERAL PERMIT IMPROVEMENTS.**

2 Section 404(e) (33 U.S.C. 1344(e)) is amended to
3 read as follows:

4 “(e)(1) **IN GENERAL.**—In carrying out the functions
5 of the Secretary under this section relating to the dis-
6 charge of dredged or fill material, the Secretary may, after
7 notice and opportunity for a public hearing, issue general
8 permits.

9 “(2) **CATEGORIES OF ACTIVITIES.**—General permits
10 may be issued on a State, regional, or nationwide basis
11 for any category of activities involving discharges of
12 dredged or fill material if the Secretary determines that
13 the activities in such category are similar in nature, will
14 cause only minimal adverse environmental effects when
15 performed separately, and will have only a minimal cumu-
16 lative adverse effect on the environment.

17 “(3) **STATE AND LOCAL PROGRAMS.**—

18 “(A) **IN GENERAL.**—A general permit may be
19 issued for an existing State, tribal, regional or local
20 regulatory program to avoid unnecessary duplication
21 of requirements by Federal, State, tribal, regional,
22 and local programs if the general permit—

23 “(i) requires that the State, tribal, re-
24 gional, or local regulatory program has jurisdic-
25 tion over the activities and waters within the
26 scope of the general permit;

14

1 “(ii) provides adequate safeguards to ensure that the State, tribal, regional, or local
2 regulatory program will have no more than
3 minimal cumulative impacts on the environment
4 and will provide at least the same degree of
5 protection for the navigable waters as that provided by this section;
6

7 “(iii) provides at least the same opportunity for public review, comment, and hearings
8 as that provided by this section; and
9

10 “(iv) includes provisions to provide an opportunity for the Secretary, the Administrator,
11 the Secretary of the Interior (acting through
12 the Director of the United States Fish and
13 Wildlife Service), and the Secretary of Commerce (acting through the Administrator of the
14 National Oceanic and Atmospheric Administration) to review permit decisions submitted to
15 the State, tribal, regional, or local regulatory agency to ensure that the requirements of this
16 subsection are met.
17

18 “(B) After December 31, 1996, a general permit shall not be issued or remain in effect for a local
19 or regional regulatory program unless the program
20 is part of a wetlands and watershed management
21
22
23
24
25

1 that approved under section 222 and the responsi-
2 sible unit of government has the legal authority and
3 scientific monitoring capability to issue, monitor
4 and enforce permits in compliance with the require-
5 ments of the Act and the terms and conditions of
6 the general permit.

7 "C. SWAMPBUSTLE.—A general permit may be is-
8 sued for discharges of dredged or fill material associated
9 with activities found by the Secretary of Agriculture, in
10 consultation with the Secretary of the Interior acting
11 through the Director of the United States Fish and Wild-
12 life Service, to be exempted from the neigibility pro-
13 visions of section 222 of the Food Security Act of 1985
14 by T.S.M. 222 pursuant to section 222 of and (1.
15 of that Act if the general permit—

16 "A. provides adequate safeguards to ensure
17 that the activities exempted will have no more than
18 minimal individual and cumulative impacts on the
19 environment, and

20 "B. includes provisions to provide an oppor-
21 tunity for the Secretary and the Administrator to re-
22 view determinations by the Secretary of Agriculture
23 to ensure that the terms and conditions of the gen-
24 eral permit and the requirements of this subsection
25 are met.

SECTION 101. REGULATIONS APPLICABLE TO GENERAL PERMITS—

(A) No general permit issued under this subsection shall be for a period of more than five years after the date of its issuance and such general permit may be renewed or modified by the Secretary after notice and opportunity to be heard is afforded hearing. The Secretary determines that the activities authorized by such general permit have an adverse impact on the environment or such activities are more appropriately authorized by individual permits of a State, Tribal or local government that failed to adequately monitor and control the individual and cumulative adverse effects of activities authorized by State, Tribal, regional or local program general permits issued under paragraph (3).

(B) Any general permit issued under this subsection shall—

(i) be based on the guidelines developed pursuant to subsection (b)(1); and

(ii) set forth requirements and standards which shall apply to any activity authorized by such permit, including specific enforcement requirements and standards for mitigation of ad-

1 verse impacts to wetlands and other navigable
2 waters.”.

3 **SEC. 8. COORDINATION AND CLARIFICATION OF PROGRAM**
4 **CONCERNING AGRICULTURAL ACTIVITIES.**

5 (a) COORDINATION WITH AGRICULTURAL PRO-
6 GRAMS.—Section 404(q) (33 U.S.C. 1344(q)) is amended
7 by inserting “(1)” after “(q)” and by adding the following
8 new paragraph:

9 “(2) Not later than one hundred and eighty
10 days after the date of enactment of this subsection,
11 the Secretary, the Administrator, the Secretary of
12 the Interior, and the Secretary of Agriculture shall
13 enter into agreements to develop consistent criteria
14 and procedures for making technical determinations
15 under subtitle C of title XII of the Food Security
16 Act of 1985 (16 U.S.C. 3821 et seq.) and this sec-
17 tion concerning wetlands located on agricultural
18 lands, including but not limited to the delineation of
19 wetlands and prior converted croplands and to pro-
20 vide information and education concerning these cri-
21 teria and procedures.”.

22 (b) EXEMPTION FOR PRIOR CONVERTED CROP-
23 LAND.—Section 404(f) (33 U.S.C. 1344(f)) is amended by
24 adding the following new paragraph:

1 “(3)(A) Areas determined in accordance with
2 subparagraph (B) to be prior converted cropland
3 shall not be considered to be navigable waters.

4 “(B) The Secretary, the Administrator, the
5 Secretary of Agriculture, and the Secretary of the
6 Interior shall promulgate regulations, after notice
7 and opportunity for public review and comment, for
8 identifying areas that meet the description under
9 subparagraph (A) for administering the programs
10 established under this section and subtitle C of title
11 XII of the Food Security Act of 1985 (16 U.S.C.
12 3821 et seq.).”

13 (c) OTHER EXEMPT WATERS AND AREAS.—Section
14 404(f) (33 U.S.C. 1344(f)), as amended by this Act, is
15 amended by adding the following new paragraph:

16 “(4)(A) For purposes of this section, the follow-
17 ing shall not be considered to be navigable waters—

18 “(i) nontidal drainage and irrigation
19 ditches excavated in uplands;

20 “(ii) artificially irrigated areas which
21 would revert to uplands if the irrigation ceased;

22 “(iii) artificial lakes or ponds created by
23 excavating or diking uplands to collect and re-
24 tain water, and which are used exclusively for
25 stock watering, irrigation, or rice growing;

1 “(iv) artificial reflecting or swimming pools
2 or other small ornamental bodies of water cre-
3 ated by excavating or diking uplands to retain
4 water for primarily aesthetic reasons;

5 “(v) water-filled depressions created in up-
6 lands incidental to construction activity and pits
7 excavated in uplands for the purpose of obtain-
8 ing fill, sand, or gravel, unless and until the
9 construction or excavation operation is aban-
10 doned and the resulting body of water meets
11 the definition of waters of the United States;
12 and

13 “(vi) artificial stormwater detention areas
14 and artificial sewage treatment areas that are
15 not modifications of navigable waters.”.

16 (d) EXEMPTED ACTIVITIES.—Section 404(f)(1) (33
17 U.S.C. 1344(f)(1)) is amended to read as follows:

18 “(f)(1) Except as provided in paragraph (2), the dis-
19 charge of dredged or fill material into navigable waters—

20 “(A) from normal farming, silviculture, and
21 ranching activities, such as haying, grazing, plowing,
22 seeding, cultivating, minor drainage, harvesting for
23 the production of food, fiber, and forest products, or
24 upland soil and water conservation practices;

1 “(B) for the purpose of maintenance, including
2 emergency reconstruction of recently damaged parts,
3 of currently serviceable structures such as dikes,
4 dams, levees, groins, riprap, breakwaters, causeways,
5 bridge abutments or approaches, and transportation
6 structures;

7 “(C) for the purpose of construction or mainte-
8 nance of farm or stock ponds or irrigation ditches,
9 or the maintenance of drainage ditches;

10 “(D) for the purpose of construction of tem-
11 porary sedimentation basins on a construction site
12 which does not involve a discharge of fill into navi-
13 gable waters;

14 “(E) for the purpose of construction or mainte-
15 nance of farm roads or forest roads, or temporary
16 roads for moving mining equipment, where such
17 roads are constructed and maintained, in accordance
18 with best management practices, to assure that flow
19 and circulation patterns and chemical and biological
20 characteristics of the navigable waters are not im-
21 paired, that the reach of the navigable waters is not
22 reduced, and that any adverse effect on the aquatic
23 environment will otherwise be minimized; or

24 “(F) resulting from any activity with respect to
25 which a State has an approved program under sec-

1 tion 208(b)(4) which meets the requirements of sub-
2 paragraphs (B) and (C) of such section,
3 is not prohibited by or otherwise subject to regulation
4 under this section or section 301(a) or 402 of this Act
5 (except for effluent standards or prohibitions under sec-
6 tion 307).”.

7 (e) COOPERATION WITH SECRETARY OF AGRICULTURE.—Section 404(f) (33 U.S.C. 1344(f)), as
8 amended by this Act, is amended by adding the following
9 new paragraph:
10

11 “(5) In carrying out this subsection, the Sec-
12 retary and the Administrator shall coordinate their
13 efforts with the Secretary of Agriculture.”.

14 **SEC. 9. MITIGATION BANKS.**

15 Section 404 (33 U.S.C. 1344) is amended by adding
16 at the end thereof the following new section:

17 “(u) MITIGATION BANKS.—

18 “(1) ESTABLISHMENT.—

19 “(A) IN GENERAL.—Not later than one
20 year after the date of the enactment of the
21 Wetlands Conservation and Regulatory Im-
22 provements Act of 1993, the Secretary and the
23 Administrator shall jointly issue rules, after no-
24 tice and opportunity for public review and com-

1 ment, for establishment, use, maintenance and
2 oversight of mitigation banks.

3 “(B) PROVISIONS AND REQUIREMENTS.—
4 Rules for establishment, use, maintenance and
5 oversight of mitigation banks shall ensure that
6 mitigation banks—

7 “(i) comply with the guidelines under
8 subsection (b)(1);

9 “(ii) to the extent practicable and en-
10 vironmentally desirable, provide in-kind re-
11 placement of lost wetlands functions and
12 be located on or in proximity to the same
13 watershed as impacted wetlands;

14 “(iii) provide for the long-term secu-
15 rity of ownership interests of wetlands and
16 uplands on which projects are conducted to
17 protect the wetlands values associated with
18 the mitigation bank;

19 “(iv) employ consistent and scientif-
20 ically-sound methods to determine debits
21 by evaluating wetlands functions and
22 project impacts at the sites of proposed
23 permits for discharges of dredged or fill
24 material pursuant to this section, and
25 methods to be used to determine credits

1 based upon wetlands functions, values, and
2 acreages at the sites of mitigation banks;

3 “(v) base fee charges for participation
4 in the mitigation bank on the full costs of
5 replacing lost wetlands functions and acre-
6 age, including the costs of land acquisition,
7 wetlands establishment, management
8 measures, long-term maintenance, monitor-
9 ing, and protection, potential remediation
10 of project failure, and other relevant fac-
11 tors;

12 “(vi) shall specify responsibilities for
13 long-term monitoring, maintenance, and
14 protection; and

15 “(vii) shall provide opportunity for
16 public review of proposals for mitigation
17 banks through one or more opportunities
18 for public notice and comment.

19 “(2) DEFINITION.—As used in this subsection,
20 the term ‘mitigation bank’ means wetlands restora-
21 tion projects undertaken by one or more parties, in-
22 cluding private and public entities, expressly for the
23 purpose of providing, in advance, mitigation com-
24 pensation credits to fully offset reasonably foresee-
25 able wetlands losses from future discharges of

1 dredged or fill material into the navigable waters,
2 where compensatory mitigation at the project site is
3 not practicable or is not environmentally desirable.”.

4 **SEC. 10. GRANT AUTHORITY FOR RESEARCH, INVESTIGA-**
5 **TION, AND TRAINING.**

6 Section 104 (33 U.S.C. 1254) is amended by adding
7 at the end the following new subsection:

8 “(v) The Secretary of the Army, acting through the
9 Chief of Engineers, is authorized to make grants to and
10 enter into cooperative agreements with State agencies,
11 interstate agencies, other public or non-profit agencies, in-
12 stitutions, organizations and individuals for purposes stat-
13 ed in paragraph (1) of subsection (a) of this section.”.

14 **SEC. 11. REPORTS AND ANALYSIS.**

15 (a) **EFFECTS OF PROGRAM ON WETLANDS.**—Section
16 404(a) (33 U.S.C. 1344(a)), as amended by this Act, is
17 amended by adding at the end the following new para-
18 graph:

19 “(6)(A) The Secretary, the Administrator, and
20 the States which have a permit program approved
21 under subsection (h)(2) shall collect and make avail-
22 able to the Congress and the public every two years
23 information regarding the effects on navigable wa-
24 ters of activities conducted under permits (including

1 general permits) issued pursuant to this section,
2 including—

3 “(i) the number of permit applications that
4 were granted, withdrawn or denied;

5 “(ii) estimates of the total acreage of navi-
6 gable waters affected adversely by issuance of
7 individual permits;

8 “(iii) estimates of the acreage of navigable
9 waters affected by each general permit, in order
10 to determine whether the individual and cumu-
11 lative adverse environmental effects of activities
12 authorized by each general permit are minimal;
13 and

14 “(iv) estimates of the acreage of navigable
15 waters preserved or restored through mitigation
16 of permitted activities and the rate of compli-
17 ance with such mitigation requirements.

18 “(B) MONITORING.—For purposes of preparing
19 reports under this paragraph, the Secretary, the Ad-
20 ministrator, and the Secretary of the Interior shall
21 jointly monitor the achievement of the policy stated
22 in section 101(a)(8) under permits issued under this
23 section.”.

24 (b) NEEDS ANALYSIS.—

1 (1) IN GENERAL.—Not later than ninety days
2 after the date of the enactment of this Act, the
3 Comptroller General of the United States shall sub-
4 mit to the Congress an analysis of the needs of the
5 Department of the Army, the Environmental Protec-
6 tion Agency, the United States Fish and Wildlife
7 Service, and the National Marine Fisheries Service
8 for additional personnel, administrative resources,
9 and funding to improve implementation of section
10 404 of the Federal Water Pollution Control Act (33
11 U.S.C. 1344) and to carry out the provisions of this
12 Act.

13 (2) CONTENTS.—The analysis submitted under
14 this subsection shall—

15 (A) give particular emphasis to the needs
16 of the agencies identified in paragraph (1) with
17 respect to improving and expediting wetlands
18 delineation and section 404 permitting, includ-
19 ing advance planning and early consultation;

20 (B) include specific recommendations re-
21 garding additional appropriations and staffing
22 necessary for that improvement and expedition;
23 and

24 (C) include specific recommendations con-
25 cerning allocation of additional appropriations

1 and staffing to the regional, district and field
2 offices of the agencies identified in paragraph
3 (1) according to the workload of those offices.

4 **SEC. 12. WETLANDS CONSERVATION, MANAGEMENT AND**
5 **RESTORATION.**

6 (a) **FUNDING FOR STATE WETLANDS CONSERVATION**
7 **PLANS.**—Section 104(b)(3) (33 U.S.C. 1254(b)(3)) is
8 amended by inserting immediately before the semicolon “
9 and for the development and implementation of State wet-
10 lands conservation plans under section 321”.

11 (b) **WETLANDS CONSERVATION, MANAGEMENT AND**
12 **RESTORATION.**—Title III (33 U.S.C. 1311 et seq.) is
13 amended by the adding at the end the following new sec-
14 tions:

15 **“SEC. 321. STATE WETLANDS CONSERVATION PLANS.**

16 **“(a) DEVELOPMENT AND IMPLEMENTATION ASSIST-**
17 **ANCE.**—Subject to the requirements established by the
18 Administrator and this section, the Administrator is au-
19 thorized to make grants to States to assist in the develop-
20 ment and implementation of State wetlands conservation
21 plans.

22 **“(b) CONTENTS OF PLANS.**—To qualify for assist-
23 ance under subsection (a), a State wetlands conservation
24 plan shall generally include—

1 “(1) management strategies and policies for
2 achieving within the State the goal under section
3 101(a)(8);

4 “(2) an inventory of wetlands resources in the
5 State;

6 “(3) a description of the major causes of wet-
7 lands loss and degradation in the State, including an
8 estimate of historical wetlands losses;

9 “(4) a description of State and local govern-
10 ment programs applying to wetlands resources in the
11 State;

12 “(5) identification of sites in the State with
13 wetlands restoration potential;

14 “(6) identification of riparian areas in the State
15 with restoration potential;

16 “(7) a schedule for implementing the elements
17 of the plan;

18 “(8) a mechanism for monitoring achievement
19 of the stated goals of the plan;

20 “(9) measures to assist in the development of
21 wetlands and watershed management plans under
22 section 322; and

23 “(10) involvement of local public and private
24 agencies and organizations which have expertise in

1 wetlands conservation or land use planning or devel-
2 opment.

3 **“SEC. 322. WETLANDS AND WATERSHED MANAGEMENT**
4 **PLANS.**

5 **“(a) DESIGNATION AND APPROVAL OF MANAGEMENT**
6 **UNITS AND ENTITIES.—**

7 **“(1) IN GENERAL.—**The Governor of a State
8 may at any time designate wetlands and associated
9 land areas within the State as a wetlands and water-
10 shed management unit.

11 **“(2) UNIT BOUNDARIES.—**The boundaries of
12 each wetlands and watershed management unit shall
13 be identified on a map and shall be based on the
14 best available scientific information and, to the ex-
15 tent practicable, consistent with the hydrological
16 units identified by the United States Geological Sur-
17 vey of the Department of the Interior as the most
18 appropriate units for planning purposes.

19 **“(3) MANAGEMENT ENTITY.—**The Governor of
20 a State shall determine the entity responsible for de-
21 veloping and implementing a plan for each wetlands
22 and watershed management unit designated under
23 this section. The management entity may be an
24 agency of State government, a local government
25 agency, a substate regional planning organization, a

1 conservation district or other natural resource man-
2 agement district, or any other public or nonprofit
3 entity which has adequate powers to carry out the
4 responsibilities authorized by this section.

5 “(4) APPROVAL.—Each designation of a wet-
6 lands and watershed management unit and a cor-
7 responding management entity under this subsection
8 shall be submitted to the Administrator and the Sec-
9 retary of the Army, acting through the Chief of En-
10 gineers (hereinafter in this section referred to as
11 ‘Secretary’), for approval. The Administrator and
12 the Secretary shall approve the designation of a
13 management unit and entity not later than one hun-
14 dred and eighty days after the date of submittal, if
15 the designation meets the requirements of this sec-
16 tion. If the Administrator and the Secretary dis-
17 approve the designation, they shall notify the State
18 in writing of the reasons for disapproval. The State
19 may resubmit the designation amended to meet the
20 objections of the Administrator and the Secretary.

21 “(b) DEVELOPMENT AND APPROVAL OF A WET-
22 LANDS AND WATERSHED MANAGEMENT PLAN.—

23 “(1) PLAN DEVELOPMENT.—An approved man-
24 agement entity shall be eligible to receive funding
25 pursuant to section 106(h), 205(j), 319(e), or

1 604(b) (or any combination thereof) for the follow-
2 ing activities in the development of a wetlands and
3 watershed management plan:

4 “(A) Inventory and mapping of—

5 “(i) all navigable waters within the
6 proposed wetlands and watershed manage-
7 ment unit; and

8 “(ii) potential wetlands restoration
9 sites.

10 “(B) Assessment of the functions and rel-
11 ative value of wetlands within the wetlands and
12 watershed management unit.

13 “(C) Categorization of activities according
14 to the degree to which they have an adverse ef-
15 fect on navigable waters within the wetlands
16 and watershed management unit.

17 “(D) Identification and adoption of pro-
18 grams, policies and measures to achieve within
19 the wetlands and watershed management unit
20 the goal under section 101(a)(8).

21 “(E) Identification of potential mitigation
22 banks.

23 “(F) Identification and adoption of meas-
24 ures to integrate wetlands planning and man-
25 agement with broader water resource and land

1 use planning and management, including flood-
2 plain management, water supply, stormwater
3 management, and control of point and nonpoint
4 source pollution.

5 “(G) Identification and adoption of meas-
6 ures to increase consistency in Federal, State,
7 and local wetlands definitions, delineation meth-
8 odologies, and permitting approaches.

9 “(H) Identification and establishment of
10 management strategies for restoring wetlands
11 on a watershed basis.

12 “(2) PUBLIC PARTICIPATION.—Each State shall
13 establish procedures, including the establishment of
14 scientific and citizens’ advisory committees, to en-
15 courage the public to participate in developing wet-
16 lands and watershed management plans under this
17 section.

18 “(3) APPROVAL OF PLANS.—

19 “(A) SUBMISSION OF PLAN.—The Gov-
20 ernor of a State may submit to the Adminis-
21 trator for approval a wetlands and watershed
22 management plan developed pursuant to this
23 section.

24 “(B) DECISION ON PLAN.—The Adminis-
25 trator and the Secretary shall, in consultation

1 with the Secretaries of the Interior, Agriculture,
2 and Commerce, and after notice and oppor-
3 tunity for public comment, approve or dis-
4 approve a wetlands and watershed management
5 plan within one hundred and eighty days of the
6 date the plan is submitted by a Governor pur-
7 suant to this paragraph.

8 “(C) PLAN REQUIREMENTS.—The Admin-
9 istrator and the Secretary shall approve a wet-
10 lands and watershed management plan submit-
11 ted pursuant to this paragraph if they deter-
12 mine that the plan satisfies each of the follow-
13 ing conditions—

14 “(i) the plan has been developed for a
15 wetlands and watershed management unit
16 designated and approved pursuant to sub-
17 section (a);

18 “(ii) the management entity with re-
19 sponsibility to carry out the plan has been
20 designated and approved pursuant to sub-
21 section (a) and has the legal authority and
22 financial resources to carry out the plan;

23 “(iii) the plan contains an inventory
24 and mapping of—

34

1 “(I) all navigable waters within
2 the proposed wetlands and watershed
3 management unit; and

4 “(II) potential wetlands restora-
5 tion sites with a description of their
6 intended functions upon completion
7 and the time required for completion;

8 “(iv) the management entity has
9 adopted programs, policies and measures
10 that will ensure achievement within the
11 watershed of the goal under section
12 101(a)(8); and

13 “(v) the plan provides that the man-
14 agement entity will report to the Adminis-
15 trator, the Secretary and the public every
16 two years on implementation of the plan
17 and on the losses and gains in functions
18 and acres of wetlands within the wetlands
19 and watershed management unit.

20 “(c) PLAN IMPLEMENTATION AND REVISION.—

21 “(1) PLANNING AND IMPLEMENTATION SCHED-
22 ULE.—Each wetlands and watershed management
23 plan submitted and approved under subsection (b)
24 shall include a planning and implementation sched-
25 ule for a period of at least ten years.

1 “(2) DURATION OF APPROVAL.—The approval
2 of a plan by the Administrator and the Secretary
3 shall apply for a period not to exceed ten years.

4 “(3) PLAN REVISIONS.—A revised and updated
5 plan may be submitted for approval prior to the ex-
6 piration of the period specified in paragraph (2) pur-
7 suant to the same conditions and requirements that
8 apply to any initial plan for a wetlands and water-
9 shed management unit that is approved pursuant to
10 subsection (b).

11 “(d) INCENTIVES FOR WETLANDS AND WATERSHED
12 MANAGEMENT PLANNING.—

13 “(1) FUNDING OF PROJECTS AND ACTIVI-
14 TIES.—Projects and activities identified in an ap-
15 proved plan as necessary for achievement within the
16 wetlands and watershed management unit of the
17 goal under section 101(a)(8), and not otherwise re-
18 quired by this or other Federal law, shall—

19 “(A) be eligible for funding under section
20 603(c)(1)(F);

21 “(B) be included in any needs assessment
22 conducted pursuant to section 516; and

23 “(C) be eligible for funding under section
24 604(a)(2)(C).

1 “(2) EXPEDITED PERMIT REVIEW.—Notwith-
2 standing section 404(a), a decision under that sec-
3 tion with respect to a completed application for a
4 permit for discharge of dredged or fill material into
5 navigable waters within a designated wetlands and
6 watershed unit and subject to an approved wetlands
7 and watershed management plan shall be made not
8 later than the sixtieth day after the date the notice
9 of such application is published under section
10 404(a)(1), unless—

11 “(A) with respect to issuance of the per-
12 mit, the Secretary is required under the Na-
13 tional Environmental Policy Act of 1969 to
14 issue an environmental impact statement;

15 “(B) the permit application involves an ac-
16 tivity that may affect any species that is listed
17 or any critical habitat that is designated under
18 the Endangered Species Act of 1973;

19 “(C) the Administrator, the Secretaries of
20 the Departments of Agriculture, the Interior,
21 Commerce, or Transportation, the head of an-
22 other appropriate Federal agency, or the Gov-
23 ernor of the State in which the activity occurs
24 requests that the decision be made after such
25 day, in which case the decision shall be made

1 not later than the ninetieth day after the date
2 the notice of application is published under sec-
3 tion 404(a)(1);

4 “(D) the Secretary and the permit appli-
5 cant determine that additional time is needed to
6 evaluate such application; or

7 “(E) the decision is precluded as a matter
8 of law or procedures required by law.

9 “(3) MITIGATION BANKS.—

10 “(A) At the request of an approved man-
11 agement entity, the Secretary and the Adminis-
12 trator shall provide assistance in establishment
13 of mitigation banks under this section and sec-
14 tion 404(u) by the approved management entity
15 to achieve the goal under section 101(a)(8)
16 within an approved wetlands and watershed
17 management unit and in accordance with an
18 approved wetlands and watershed management
19 plan.

20 “(B) Establishment and oversight of miti-
21 gation banks within an approved wetlands and
22 watershed management unit and in accordance
23 with an approved wetlands and watershed man-
24 agement plan shall be eligible for funding under
25 paragraph (1).

1 “(4) PROGRAMMATIC GENERAL PERMITS.—

2 After December 31, 1996, a general permit may be
3 issued or remain in effect under section 404(e)(3)
4 for a local or regional regulatory program if the pro-
5 gram is part of a wetlands and watershed manage-
6 ment plan approved under section 322.

7 “(f) RESEARCH PROGRAM.—The Administrator, in

8 cooperation with the Secretary, the Secretary of the Inte-
9 rior and other appropriate Federal, State, and local gov-
10 ernment entities, shall initiate a research program of wet-
11 lands and watershed management. The research program
12 shall include—

13 “(1) study of the functions, values and manage-
14 ment needs of altered, artificial, and managed wet-
15 lands systems;

16 “(2) study and development of techniques and
17 methods for determining and analyzing the functions
18 and values of different types of wetlands;

19 “(3) study and development of techniques for
20 managing and restoring wetlands within a watershed
21 context;

22 “(4) study and development of techniques for
23 better coordinating and integrating wetlands protec-
24 tion, floodplain management, stormwater manage-

1 ment, point and nonpoint source pollution controls,
2 and water supply planning on a watershed basis;

3 “(5) development of criteria for identifying wet-
4 lands restoration sites on a watershed basis; and

5 “(6) recommendation of procedures and ecologi-
6 cal criteria for wetlands restoration.

7 **“SEC. 323. INTERGOVERNMENTAL WETLANDS COORDINAT-
8 ING COMMITTEE.**

9 “(a) **ESTABLISHMENT.**—Not later than ninety days
10 after the date of the enactment of the Wetlands Conserva-
11 tion and Regulatory Improvements Act of 1993, the Ad-
12 ministrator shall establish a committee to coordinate Fed-
13 eral, State, and local government wetlands policies (here-
14 inafter in this section referred to as the ‘Coordinating
15 Committee’).

16 “(b) **FUNCTIONS.**—The Coordinating Committee
17 shall—

18 “(1) assist in coordinating Federal, State, and
19 local wetlands policies;

20 “(2) make comments available to the Secretary
21 of the Army, acting through the Chief of Engineers,
22 or the Administrator regarding existing and pro-
23 posed regulatory, policy, program, or technical guid-
24 ance affecting wetlands systems;

1 “(3) in cooperation with the Secretary of the
2 Army, acting through the Chief of Engineers, and
3 the Administrator, assist in the review and field-test-
4 ing of technical and scientific methods utilized in
5 wetlands regulatory and non-regulatory program;

6 “(4) encourage the development and implemen-
7 tation of State wetlands conservation plans pursuant
8 to section 321;

9 “(5) encourage the development and implemen-
10 tation of wetlands and watershed management plans
11 pursuant to section 322; and

12 “(6) assist in the development of a national
13 strategy for the restoration of wetlands ecosystems
14 pursuant to section 324.

15 “(c) MEMBERSHIP.—The Committee shall be com-
16 posed of eighteen members as follows:

17 “(1) The Administrator.

18 “(2) The Secretary of the Army, acting through
19 the Chief of Engineers.

20 “(3) The Secretary of the Interior, acting
21 through the Director of the United States Fish and
22 Wildlife Service.

23 “(4) The Secretary of Agriculture, acting
24 through the Chief of the Soil Conservation Service.

1 “(5) The Under Secretary of Commerce for
2 Oceans and Atmosphere.

3 “(6) One individual appointed by the Adminis-
4 trator who shall represent the National Governor’s
5 Association.

6 “(7) One individual appointed by the Adminis-
7 trator who shall represent the National Association
8 of Counties.

9 “(8) One individual appointed by the Adminis-
10 trator who shall represent the National League of
11 Cities.

12 “(9) Ten State wetlands experts selected and
13 appointed by the Administrator from among nomina-
14 tions submitted by the Governors of each State.

15 “(d) TERMS.—Each member appointed pursuant to
16 paragraph (6), (7), (8), or (9) of subsection (c) shall be
17 appointed for a term of two years.

18 “(e) VACANCIES.—A vacancy in the Coordinating
19 Committee shall be filled, on or before the thirtieth day
20 after the vacancy occurs, in the manner in which the origi-
21 nal appointment was made.

22 “(f) PAY.—Members shall serve without pay, but may
23 receive travel expenses (including per diem in lieu of sub-
24 sistence) in accordance with sections 5702 and 5703 of
25 title 5, United States Code.

1 “(1) be designed to help coordinate and pro-
2 mote restoration efforts by Federal, State, regional,
3 and local governments and the private sector;

4 “(2) inventory and evaluate existing restoration
5 efforts and make suggestions for the establishment
6 of additional efforts and funding mechanisms for
7 such efforts consistent with existing Federal, State
8 and local programs and plans;

9 “(3) evaluate the role played by, and success of,
10 wetlands restoration efforts in both regulatory and
11 nonregulatory contexts;

12 “(4) evaluate current efforts to monitor restora-
13 tion efforts;

14 “(5) periodically report on the status of wet-
15 lands restoration efforts; and

16 “(6) identify regulatory and nonregulatory ob-
17 stacles to wetlands ecosystem restoration and rec-
18 ommend methods to remove such obstacles.”.

**GENERAL STATEMENTS SUBMITTED FOR
THE RECORD**

American Public Power Association

2301 M Street, N.W.
 Washington, D.C. 20037-1484
 202/467-2900

**Statement of
 American Public Power Association
 to the
 Senate Clean Water, Fisheries and Wildlife Subcommittee
 of the Senate Environment and Public Works Committee
 on S. 1114, a bill to amend the Clean Water Act**

August 20, 1993

The American Public Power Association, the national service organization representing nearly 2,000 publicly owned electric utilities, appreciates this opportunity to present public power's views on the Section 401 certification process for hydroelectric generation projects as authorized under the Clean Water Act of 1972. Legislation to authorize this expansion has been introduced by Environment and Public Works Committee chair Max Baucus (D-MT) and ranking member John Chafee (R-RI), in the form of S. 1114.

APPA supports the reauthorization of the Clean Water Act, but opposes the inclusion of provisions in S. 1114 that would expand state authority to regulate water use, in addition to water quality, in the Section 401 Water Quality Certification process. Enactment of any provision to expand the water quality certification process to issues beyond the protection of water quality could disrupt the Federal Energy Regulatory Commission's (FERC) hydroelectric licensing and relicensing process and jeopardize power production capacity at existing federally licensed projects. In addition, APPA objects to language in the bill that would severely limit the activities of federal hydropower projects by subjecting such projects to new watershed planning activities governed by the states.

The Importance of Hydropower Generation

APPA has considerable interest in this legislation because hydro facilities constitute nearly 23 percent of public power's total installed generating capacity. The combined capacity of all public power hydro projects is more than 18,000 megawatts out of a national capacity figure from all FERC-licensed hydro projects of approximately 47,000 megawatts.

Hydroelectric generation is a clean, renewable source of energy, whose use limits the emissions that would otherwise result from the burning of fossil fuels. In fact, hydropower resources have the potential to provide a greater portion of the nation's electric power needs without any additional emissions of carbon dioxide, the most commonly-known greenhouse gas. The development of additional hydropower resources from existing projects and non-power dams could offset carbon emissions 6 million metric tons per year by the year 2000. Other special characteristics of hydropower include: a) use of an endlessly replaceable inflation-free fuel--falling water supplied by rain and snow; b)

potential plant life of as long as 100 years, or more, with stable prices; c) environmental advantages stemming from a lack of the need to transport and store fuel and waste; d) low outage rates and high reliability; e) ability to store electricity in the form of impounded water; f) 90 percent efficiency (compared to 35% for a fossil-fueled steam plant); g) employment of an indigenous North American energy source of "juice for jobs"; and h) multi-purpose nature involving not only power production but also irrigation, flood control, navigation, municipal and industrial water supply, fisheries improvement, salinity control, wildlife enhancement and recreation.

Section 401 Water Quality Certification Process

APPA believes that it is not necessary to expand the 401 permit process to allow states to withhold their water quality certification of federally licensed projects if the project does not "allow for the protection, attainment, and maintenance of designated uses." (Section 602 of S. 1114). Our position is based on the simple fact that there are other more appropriate mechanisms already available within the hydro licensing process that accomplish the same objectives without jeopardizing energy production or regional energy strategies. The current process provides the necessary framework to resolve differences among competing uses and interests of the nation's waterways.

In establishing the hydroelectric licensing process under the Federal Power Act, Congress carefully weighed the need to balance competing uses for the nation's waterways. It took the approach that all concerns and issues needed to be brought to the same table in the licensing process, with a single decision-maker weighing all factors and reaching a balanced decision. FERC was given this authority. Some states have wanted to unravel the unified approach that Congress took and to assert their own authority to over-ride FERC's authority. In implementing the Clean Water Act, states would have a significantly more narrow focus of the issues. For example, the state's consideration of water quality would not include energy, reservoir recreational opportunities or water supplies.

The piecemeal approach to licensing advocated by states will never work. Congress has always recognized the need for a comprehensive approach that balances competing uses on not only an intrastate but interstate basis.

In testimony APPA provided to the full Committee in July, 1991, we submitted that hydro projects have far reaching effects beyond individual state interests. It is as true now as it was then. In the Pacific Northwest region for example, regulation of unilaterally imposed, single purpose constraints, such as minimum flow requirements, could have impacts far beyond an individual project. Such requirements could affect not only the individual project upon which they are imposed, but potentially every project and utility in the entire coordinated system. These effects are felt across state and international boundaries and could result in the disruption of the economic viability of projects hundreds of miles downstream, impacting thousands of communities and the people residing within them.

Proponents of expanding the Section 401 permit process on hydro projects argue that environmental values will receive better treatment by the states than from FERC. The fact is that disjointed operation of the rivers will result in more environmental degradation than will be the case with coordinated

operation. Further, by law, FERC must explicitly consider environmental values in the licensing process.

The congressional mandate to consider environmental values was substantially strengthened by the passage of the Electric Consumers Protection Act (ECPA) of 1986--a law that requires FERC to balance carefully environmental factors with power generation needs in rendering its license decisions. Under ECPA, there have been a number of cases in which FERC has placed more stringent environmental conditions on a license than the state had required under the project's approved 401 permit.

APPA does not question the value of coordinating the policy objectives of environmental statutes, or belittle the responsibility of appropriate state and federal agencies to steward the nation's precious resources. However, ensuring that natural resources are used for the maximum public benefit requires that one agency, not a multitude of agencies, has the ultimate authority to review the project and render a decision.

The need to expand the 401 certification process beyond the issue of pure water quality has yet to be proven. There is no clear and convincing evidence that the current process does not work, or that the process works to the detriment of the states or environmental interests. The FERC licensing process provides an appropriate, coordinated, and balanced public policy process that permits competing uses of the nation's waterways to be appropriately considered. To set up any other procedure would be unwise and, most importantly, would run counter to the public interest.

Watershed Management Plans

APPA is concerned with the provision from Section 302, watershed management plans, which proposes to make each activity of a federal agency that affects land use, water quality, or the natural resources within a watershed planning unit for which a plan has been approved be carried out in a manner that is consistent with the policies established in the plan. An exemption to this requirement will be allowed only when the President determines that the federal activity in question is in the paramount interest of the United States.

Our concern is that this provision could severely limit the activities of federal hydropower projects. Affected projects include those operated by the Corps of Engineers and the Bureau of Reclamation. Power produced by these projects is sold primarily to public power systems and rural electric cooperatives by the U.S. Department of Energy's Power Marketing Administrations.

The questions we ask of this provision include whether the management plan will have independent regulatory effect apart from current state water quality standards, and who makes the determination that each federal activity will be carried out in a manner consistent with the newly-established watershed management plans.

In general, APPA believes that the creation of voluntary watershed management plans submitted by the states and approved by the Environmental Protection Agency Administrator could enhance overall efforts to identify problems associated with water quality within the designated watershed and aid in the

selection of measures to meet planning goals. However, if Section 302 is intended to require a second tier state evaluation of whether a proposed federal activity would meet state water quality standards, it could result in duplicative and expanded state authority in a process presently laden with layers of regulatory review. Under such a process, each state could strip federal agencies of their authority to comprehensively review a proposed project's affects on a waterway and could ultimately preclude beneficial development of our nation's waterways.

APPA agrees with the National Hydropower Association's recommendation that "any independent consideration of the consistency of a proposed activity with the state watershed management plan should be conducted by the federal agencies responsible with authorizing the relevant activity. The plans should be taken into account with deference by the federal agency in making its determination of the public interest in acting on a specific proposal."

APPA is additionally concerned about what Section 302 intended in allowing the Governor to select, as one option, a "non-profit entity with the capacity to carry out the responsibilities authorized by this section (Watershed Management Plan, Section 302)." We question the logic behind the option of selecting a non-profit entity to handle such elevated regulatory responsibilities and suggest that such an entity be one that has legal authority and financial resources and experience to fulfill its management responsibilities.

Lastly, the requirement that any federal activity shall be consistent with watershed management plans and may be exempted only on the basis of a Presidential exemption strikes us as a particularly harsh obstacle to overcome. We question the rationale behind this exemption provision and welcome the opportunity to more fully discuss the problems and potential merits behind structuring a more reasonable alternative.

**Improving Water Resource Management in the United States:
Suggestions for Reauthorizing the Clean Water Act***

Robert W. Hahn

American Enterprise Institute
1150 17th St., N.W.
Suite 1100
Washington, D.C. 20036

Prepared for the Committee on the Environment and Public Works
U.S. Senate

23 July 1993

*The author is a Resident Scholar at the American Enterprise Institute and an Adjunct Research Fellow, John F. Kennedy School of Government, Harvard University. I would like to thank Marilyn Arnold, Dan Dudek, Scott Farrow, Barry Korb, Mark Luttner, and Zach Willey for helpful discussions. The views in this testimony reflect those of the author and do not necessarily reflect those of the institutions or individuals with which he is affiliated.

**Improving Water Resource Management in the United States:
Suggestions for Reauthorizing the Clean Water Act***

Robert W. Hahn

1. Introduction

Thank you for inviting me to testify.

The purpose of my presentation is to persuade you that there is an alternative to traditional water quality regulation that is, as the commercial says, "less filling and tastes great." We now have the know-how to achieve improved levels of water quality at lower cost to the public, provided that you are willing to embark on a new approach to regulating water.

I have spent the last ten years trying to develop and implement more effective approaches for resource and environmental management throughout the world. A central focus of my recent work has been on the development of economic approaches for improving water quality and water management. I attach an op-ed from the New York Times that illustrates the kind of market-based approaches that I would like to see encouraged in the reauthorization of the Clean Water Act. It is a proposal to reduce phosphorus loads to the Everglades through introduction of a market in transferable restoration credits. The proposal is very similar in structure to the 1990 Clean Air Act provisions for cutting sulfur dioxide emissions by 10 million tons. The idea is to give industry greater flexibility in achieving ambitious environmental goals, thus saving money and, in some cases, jobs.

I would like to begin my presentation with a quotation from a great, and now defunct, economist. Joan Robinson once asked: "Why is there litter in the public park, but no litter in my back garden?" The answer, of course, lies with incentives -- each of us has a direct incentive to keep our backyard clean. And while each of us would like to see the park kept clean, we would prefer that other people do it while we are out on the beach getting a sun tan.

The same problem arises in managing U.S. water resources, the subject of my remarks today. Because we collectively own most of our major water bodies, none of us has an incentive to take care of these resources the way we would take care of our own home. The problem for Congress is, thus, to change the incentive structure so that individual consumers, governments, and businesses have a direct stake in taking better care of our precious water resources.

There are basically two approaches to changing the incentive structure to achieve better management of water resources. The first is to sell off major public waterways, including rivers, lakes and streams. Putting these assets in private hands has the potential to improve their use provided property rights for both water

quality and quantity are well-defined and enforceable. In this case, the new owners of these assets would have a very strong incentive to treat these water resources just like they treat their own backyard. That is, they would have an incentive to keep the water body clean and allow people to use the water body only if they paid a price that reflects the value of the resource.

Privatizing water resources could also start a political firestorm, if not a revolution. Thus, I will not advocate it here today.

Instead, I will focus on a second approach to improving the management of resources -- the introduction of "economic" approaches for improving the public management of water resources. Within the economic approach, there are two fundamental issues that need to be addressed -- the first is the identification of appropriate goals for water quality and water use; the second is to choose appropriate methods for achieving goals.

The choice of goals for water quality should depend, among other things, on the economic benefits associated with consuming or using the water resource as well as the economic costs of providing that resource. The benefits include preservation of species habitat, recreational uses such as fishing, swimming and boating, commercial uses, the ability to use the resource as a drinking water supply, and the satisfaction that comes from knowing waterways are clean.

2. Introducing Cost-Benefit Analysis

In conventional cost-benefit analysis, standards are intended to be set so that the incremental benefit from cleaning up the water just equals the incremental cost. Admittedly, these concepts are difficult to quantify, particularly on the benefit side. Nonetheless, it is absolutely imperative that efforts be made to quantify these concepts if clean water policy is to be developed in a way that is likely to lead to improvements in our standard of living.

The U.S. Environmental Protection Agency (EPA) has not devoted significant resources to developing analyses that suggest where regulatory efforts are best focused under the Clean Water Act. The most comprehensive analysis of the benefits and costs of current plans to achieve the objectives of the Clean Water Act has been performed by Lyon and Farrow (1993). These authors argue that in many current implementation plans, the incremental costs of improving water quality exceed the incremental benefits. This means that many of the standards and regulatory methods that EPA has promulgated to date may be wasteful in the sense that they actually lower our average standard of living. At the same time, there may be specific instances of heavily polluted and/or heavily used water bodies where significant improvements in water quality are well worth the cost.

The preliminary results by these authors and results from earlier studies suggest that more attention needs to be given to doing cost-benefit analysis so that Congress can be certain we are focusing on the right water problems in the right water bodies.

Recommendation 1: EPA should commission a state-of-the-art cost-benefit analysis of the current Clean Water Act by scientists and social scientists so that the political debate on Clean Water Act reauthorization can be better informed. This analysis should attempt to point out where standards could benefit from tightening and where standards could benefit from being relaxed.

The analysis also should identify key areas of uncertainty in the estimation of benefits so that decision makers can make more informed decisions about appropriate standards. At present, relatively little is known about the dose-response function for many water contaminants or how people value clean water that they, themselves, may not use.

Recommendation 2: EPA should develop a database that permits a more refined assessment of the benefits and costs of the Clean Water Act.

EPA should be required to submit a report to Congress every two years that addresses the benefits and costs of controlling different pollutants in different waterways.

The second recommendation is similar to a provision in the 1990 Clean Air Act Amendments, which calls for a cost-benefit analysis of selected statutes in the Act. Without such information, Congress will not be in a position to make informed decisions about the economic consequences of their proposed statutes.

3. An Overview of Economic Incentives

Once a standard has been chosen, the question arises as to what is the least costly way of achieving that standard. One way is to prescribe a technology that each company in an industry must use. This is sometimes referred to as "command-and-control" regulation. Command-and-control regulation has been criticized by economists because it does not leave businesses and individuals with much choice in how they achieve an environmental target. For example, a law may require that a power plant use a scrubber to reduce air pollution, regardless of whether another technology or group of technologies might be more effective in achieving the same level of air quality.

Economists have argued that many pollution problems can be addressed

more effectively through the introduction of economic incentives. The idea behind using economic incentives is to save resources while achieving a particular environmental goal. For example, in 1990, the Congress adopted an economic incentive approach for limiting acid rain that could save society as much as \$1 billion annually when compared to a conventional command-and-control approach that required the largest polluters to install scrubbers.

There are many different kinds of economic incentive approaches. They include the use of subsidies, taxes, deposit-refund schemes, marketable permits, and the removal of institutional barriers that lead to price distortions. In the interest of brevity, I would like to focus on charges (taxes) and marketable permits.

Charge systems impose a fee or tax on pollution. For example, a chemical manufacturer would be charged for every unit of pollutant that it discharged into a river. Several European nations, including France, the Netherlands, and West Germany currently use water pollution charge systems.

Pollution charges, by themselves, do not restrict the amount of pollutants that may be emitted; rather, they tax emissions. Such fees ensure that a firm will internalize the previously external pollution costs and be forced to perform a profit and loss calculation in order to respond efficiently to the fee. A firm has many options. It might decide that it is in its interest to pay the fee, completely eliminate the discharge, or partially reduce the emission.

The advantage of the fee system is that all businesses face the same incentive to limit pollution at the margin. A firm will control pollution up to the point where the marginal cost of control just equals the fee. The result is that the total costs of pollution control are minimized, when compared with other methods of allocating the pollution control burden across businesses. Pollution charges, like other market-based mechanisms, also provide ongoing incentives for businesses to develop and adopt newer, better pollution control technologies.

One problem with emission charge systems is that governments do not know in advance what level of cleanup will result from any given charge. This problem stems from a lack of knowledge about how businesses will respond to a given level of taxation. Governments do not have the information to determine either an individual firm's pollution control costs or the distribution of costs across businesses. This inability to specify a target level of pollution that will be achieved does not, however, alter the reality that charges have the potential to achieve emission reductions at substantially lower cost than command-and-control regulation.

Marketable Permit Systems

Marketable or tradeable permits can achieve the same cost-minimizing allocation of the pollution control burden as a charge scheme, while also avoiding the problem of uncertain responses by businesses. Under a tradeable permit system, the allowable overall level of pollution is established and then allotted to businesses and government entities in the form of permits. A business that keeps its emission levels below the allotted level may sell or lease its surplus permits to others.

As with a charge system, the marginal cost of control is identical across businesses and thus the total cost of control is minimized for any given level of total pollution control. In the case of local water pollution control, for example, this approach could be substantially more efficient than current regulatory methods, both because its inherent flexibility takes advantage of differences in control costs, and because it allows individual businesses to decide where and how to make desired reductions in loadings.

In the event that overall loading targets are viewed as too strict, the government may choose to increase the supply of permits. Likewise, in order to reduce allowable emissions, regulators could take the opposite stance and reduce the supply of permits.

Permit systems have been used primarily in the United States. Examples include: the Environmental Protection Agency's Emissions Trading Program for air; the nationwide lead phasedown in gasoline, which allowed fuel refiners to trade reductions in lead content; and the gradual phase out of chlorofluorocarbons in the U.S., where businesses are allowed to trade the right to produce or import limited quantities of these chemicals. In addition, several western states have implemented water quantity trading in limited forms. Some states also are considering water environmental credit trading programs to achieve least-cost approaches for controlling discharges from farms and municipal wastewater treatment plants.

4. Encouraging the Use of Economic Instruments for Better Water Management

Congress could encourage EPA to implement both fee systems and marketable permit approaches. Because I believe fees are likely to encounter more political resistance, I believe Congress should promote more widespread use of marketable permits for improving water resource management.

The subsequent recommendations highlight the potential for encouraging greater use of marketable permits.

Recommendation 3: EPA should be required to implement marketable permits as the tool of choice for improving water quality, or justify in writing why it has not chosen this alternative.

The point of this recommendation is to encourage EPA to rely more heavily on market-based approaches for improving water quality rather than the command-and-control approach used for the last twenty years.

Recommendation 4: Congress should encourage EPA and the states to implement trading of environmental credits between point sources where technology-based requirements do not lead to the attainment of water quality goals (i.e., in "water quality limited" areas).

Recommendation 5: Congress should encourage EPA to allow for trading between dischargers whose effluent is then treated at a sewage treatment plant.

The point to point source trading between sources, such as municipal treatment plants and industrial sources, has the potential to save money and stimulate environmental innovation. So, too, does trading between dischargers whose effluent is treated at sewage treatment plants.

Recommendation 6: Congress should encourage trading with non-point sources, including trading between point and non-point sources and trading among non-point sources.

It is becoming increasingly apparent that many problems with water quality arise because non-point sources, such as agricultural runoff, are typically unregulated or minimally regulated. For example, over 18,000 water bodies will not attain water standards even if all point sources were to meet their technical requirements. While EPA has acknowledged non-point sources are a major problem, there have been few advances in regulation over the last twenty years.

There appears to be a great potential for achieving cost savings if non-point sources can be brought into the system. One way to bring them into the system is for EPA to develop guidelines for trading with non-point sources. Even if non-point sources remain largely unregulated, heavily regulated point sources should have the ability to trade with non-point sources provided they can show that water quality will improve as a result of the trade.

The technical challenges of regulating non-point sources are large, but surmountable. For example, I have proposed a transferable restoration credit system for the Everglades in South Florida that allows phosphorus to be measured at specified pump stations in the Everglades Agricultural Area. Where monitoring can only be done at great cost, then experts may need to use best practical judgment along with trading ratios to assure that water quality would improve. For example, in an application of this concept to the Hawkesbury-Nepean River system in Sydney, Australia, I am working with the government to establish trading rules for

phosphorus reductions for farmers. These reductions would reduce the occurrence of blue green algae blooms in the river system.

It is important to note that the technical challenges of regulating non-point sources are not unique to a market-based approach, but apply to all regulatory systems including command-and-control. If monitoring costs of actual loadings are too high, then other alternatives may be appropriate. For example, in the case of phosphorus use on farms, it may be preferable to impose a tax on inputs, such as fertilizer, basing the tax on expected harm to the water body.

A key advantage of introducing trading with non-point sources is that it provides environmental benefits while lowering the overall cost of regulation. If regulation of these sources remains largely voluntary, a market-based approach provides a positive incentive for these sources to participate in limiting their water pollution.

The concept of trading can be expanded to wetlands.

Recommendation 7: Congress should encourage EPA to develop and implement rules for trading among different kinds of wetlands.

The idea is to encourage the preservation of wetland functions while promoting economic growth. Because artificial wetlands can be constructed, there is scope for trading among wetlands. Establishing the rules for trading will be a challenge. EPA should be instructed to provide guidance on this issue in a timely manner, explicitly recognizing that different wetlands serve different functions. The practice of building or maintaining wetlands in exchange for specific forms of development has been tried successfully in Florida with the construction of Disney World. I propose to expand on that idea, allowing individuals greater flexibility in managing wetlands while preserving the environmental integrity of the wetland system.

Under current law, regulated entities would be required to meet technology-based requirements. This command-and-control regulation should be supplanted by market-oriented regulation that focuses on the environmental performance of the water body in question.

Recommendation 8: Congress should encourage EPA and the states to establish total maximum loads for all non-attainment water bodies.

Recommendation 9: For those areas where a load-based water quality standard is defined, Congress should permit the states to implement a trading system that does not require businesses to meet a specific technology-forcing requirement, provided that it can be shown that trading leads to a comparable or better outcome in terms of water quality.

The focus on environmental outcomes is likely to lead to better environmental quality at lower cost. Where there are damage thresholds associated with specific sites, some command-and-control regulation may be necessary to set the maximum ceilings on loads from a specific site or a cluster of sites. Nonetheless, the goal of regulation should be to provide the maximum improvement in environmental quality per dollar spent. This goal is best achieved through making greater use of market-based approaches for preserving and enhancing water quality.

While most, if not all, of the preceding recommendations could be implemented under the existing Clean Water Act, explicit Congressional support for marketable permits will spur their use.

Recommendation 10: Congress should insert language in the new Clean Water Act that demonstrates its commitment to the widespread use of marketable permits for improving the quality and economic value of the nation's water resources.

Congress should make it clear that it is primarily concerned with making necessary improvements in water quality in a timely manner. The precise method of achieving those environmental improvements should be left to business and government entities responsible for making the reductions needed to meet those goals.

5. Whither Water Regulation?

A fundamental concern for the 1990s will be integrating water quality and quantity concerns. My testimony has focused primarily on quality issues, but the two issues are inextricably linked. Just as quality can be improved through the introduction of markets, so, too, can water quantity. Moreover, markets for water quantity may also improve water quality by encouraging non-point sources of pollution to conserve water. While water quantity issues generally are subject to state law, the federal government could help by endorsing the use of water markets and allowing the transfer of water contracts for federal reclamation water supply projects.

We have the technical know-how to implement economic instruments for improved water quality and allocation. The question is whether we have the political will. I am optimistic that more markets for improving water management will be introduced. My only question is whether Washington will lead the charge or follow. The reauthorization of the Clean Water Act provides you with a unique opportunity to lead the charge. I hope you take advantage of this opportunity to benefit the health and welfare of the American people.

Thank you.

**STATEMENT OF AMERICAN FARM BUREAU FEDERATION
TO THE HOUSE PUBLIC WORKS AND TRANSPORTATION SUBCOMMITTEE
ON WATER RESOURCES AND ENVIRONMENT
REGARDING CLEAN WATER ACT REAUTHORIZATION**

**Presented by Keith W. Eckel
President
Pennsylvania Farm Bureau
and
American Farm Bureau Federation Board Member**

April 22, 1993

Thank you Mr. Chairman. My name is Keith Eckel, and on behalf of the American Farm Bureau Federation we appreciate the opportunity to speak to you about the reauthorization of the Clean Water Act. Water quality is of great interest to Farm Bureau's nearly four million member families. Farm families have an inherent self interest in protecting water quality. Our families, our livestock and our crops and our land are usually the first to be affected by a degradation of water quality.

From the perspective of farmers and ranchers, there are three broad aspects to the Clean Water Act that need your attention. First, a non-point source program that retains the basic tenants of the current 319 program. Second, is the need for a clear, comprehensive wetland policy. And third, an adequate commitment of resources to make it work.

NONPOINT SOURCE

This issue has been a priority for farmers and ranchers for many years and there is a tremendous amount of activity on farms and ranches across the country. Farmers are reducing erosion and increasing efficiency of chemical use. For example:

- ◆ Soil erosion has been reduced 90 percent or more on 35.5 million acres of land that is in the Conservation Reserve Program,
- ◆ Crop protection chemicals used by farmers are down 20 percent from 1982, and
- ◆ Corn's nitrogen fertilizer use efficiency is up 14 percent since 1980.
- ◆ Implementation of conservation compliance plans on highly erodible soils is slightly ahead of the expected rate with 58 percent of planned acres fully implemented. (See attachment #1 and #2.)
- ◆ Over 88 million acres of cropland are under conservation tillage systems providing residue cover of 30 to 90 percent,
- ◆ An additional 73 million acres of cropland has 15 to 30 percent residue cover providing substantial erosion control benefits, particularly in small grain production areas of the great plains.

- ♦ "No-till" farming practices soybean acres quadrupled between 1989-1992 to 8.2 million acres.

"The assumption that American agriculture is incapable of far-reaching change is not true; the changes we have seen in tillage and pest control over the past 20 years would have been considered revolutionary in 1969." —Dr. R.G. Hoeft and E.D. Nafziger, University of Illinois

As an industry, we are more mindful of the potential for adverse impacts of our activities. The process of education and promoting awareness began many years ago. Attached is a summary of several of the environmental initiatives that American Farm Bureau Federation has had on-going over the last 10 years which support the effort to protect our water resources. (See attachment #3.)

As with many issues, perception and reality often tend to reach different conclusions. Despite the perceptions, all indications are that surface water quality is improving and the trend will more than likely continue in that direction for some time. Senator Chafee has noted that 80 percent of the nation's waters now meet the Clean Water Act's goal of being fishable and swimmable. That is something we ought to be shouting about! We are making great progress!

We believe, Mr. Chairman, that it is important for the general public to know that whatever water problems exist in rural America they are manageable problems. We are not in a

water quality crisis situation.

Agricultural chemicals are also often perceived as one of the "major threats" to water quality. However, the EPA National Pesticide Survey went looking for 126 pesticides and or breakdown products in rural drinking water wells and community wells and **DID NOT** find 110 of them. Those that were found were generally present at levels that were not threatening to human health.

Our members have been testing their own wells in record numbers through cooperative programs developed by Farm Bureau. More than 40,000 wells in 19 states have been tested for nitrate. More than eighty percent of the tests showed nitrate levels in the range of what is normally considered naturally occurring background levels.

Mr. Chairman, modern agricultural technology should not be viewed as the problem, but rather the solution. The amount of cultivated land in the United States is approximately 340 million acres. That is approximately the same amount of land in production at the turn of the century. However, the U.S. population (consumers) has increased by 179 million people, while the number of farmers has steadily declined. Farmers account for less than one percent of population today. Despite these trends we have not only been able to meet the rising domestic demand for food consumption, but we are exporting approximately 30 percent of our production abroad. Furthermore, we are today idling more land to conservation than ever before and employing better conservation on the land we crop. If it were not for the advances in technology, our domestic demand for food could require as much as 800 million acres of additional cropland. It is **because of technology** such as pesticides and fertilizers and increased efficiencies produced through agricultural research, that land is **now available** for conservation set asides, wetland restoration, wildlife habitat, forest restoration, parks and

wilderness areas. And, similarly, 99 percent of the population is free to pursue occupations other than self-sustenance. Today we have more woodlands, more wildlife, more conservation, than at anytime in over a century. That has had and will continue to have a benefit to water quality.

When setting policy, it is important to look at the long-term trends and avoid decisions based on historical snapshots. In the state of Iowa for example, the use of commercial fertilizers have been blamed for elevated levels of nitrate in the Des Moines River. Ironically however, the Leopold Center for Sustainable Agriculture at Iowa State University has recently issued a report that calls this into question. Their research found that nearly 50 years ago, before commercial nitrogen fertilizers began to be used extensively, the nitrate level in the river was already nearly the same as it is today. It is important that we understand the nature of the problem in order to effect the right solution.

As this Committee prepares to reauthorize the Clean Water Act provisions addressing nonpoint source runoff, I would like to offer several observations that come from our experiences in working with landowners on water quality issues.

1. Farmers and ranchers want to do what is right for the environment. They will respond to problems when provided with sound, scientifically based information and reliable cost-effective solutions.

2. Our public policies affecting water quality should be based on fact, not perception. There is a critical need for continued research and a greater understanding of the site-specific linkages between farm practices and water quality. We ought to have the facts to support policy. The cost of being wrong is simple too great. Sound policy must be based on more than grab samples and generalizations.

3. We believe the programs and solutions that work best are those that come from the grass-roots up. Achieving improved water quality practices is best accomplished by voluntary, locally designed and implemented site-specific solutions. We should avoid the temptation to adopt "one-size-fits-all solutions". In looking at the successes of USDA's Rural Clean Water Program, it was clear that the more local people took control of the effort, the better the results.

It is equally important to realize that these practices must be put into use before any benefit is to be achieved. Therefore, we need a sound, trusted and reliable delivery system of information, technology, and assistance to the farm-gate. The concept of State primacy in Sec. 319 should be maintained.

"We must realize that we cannot turn the clock back to the good old days of the 1930's when the world population stood at 2 billion people and few agricultural chemicals were used. Given current scientific knowledge, it is my belief that the judicious use of agricultural—especially chemical fertilizers—is absolutely essential to produce food needed to feed today's population of 5.3 billion, which is currently increasing at the rate of 88 million per year."
—Dr. Norman Borlaug, Nobel Laureate

4. As I mentioned above, achieving water quality improvements is a process that takes time to show results. We should take a reasoned, long-term approach to water quality improvement and avoid the temptation to make decisions based on historical snapshots.

An assessment from Dr. George Halberg, of the Iowa Department of Natural Resources who has spent a decade on the widely known Big Spring water quality improvement project in northeast Iowa sums up the situation.

“We need time. Even if we could do it—implement all known BMP’s today—we’d still be a decade away from proving changes in water quality. —Dr. George Halberg, Iowa Department of Natural Resources”

5. There is an urgent need to consolidate efforts. One of the major problems facing farmers today is the multitude of duplicate programs. We have, as a base, the voluntary Agricultural Conservation Program (ACP) and general conservation technical assistance. For farmers who voluntarily wish to receive USDA program benefits there’s the Food Security Act’s mandatory conservation compliance, sodbuster and swampbuster programs. There is the voluntary Conservation Reserve Program, the Water Quality Incentive Program, the Clean Water Act Sec. 319 programs developed by many states, and there are the regional Gulf of Mexico, Chesapeake Bay, Great Lakes and Great Plains programs. In addition, farmers in many of areas will soon be responding to the Coastal Zone Act Reauthorization Amendments as their state begins implementation. We’ve had the Rural Clean Water Program, the Hydrologic Unit Area Projects Demonstration Program and many others.

Each of these can have a positive impact on water quality, but it makes no sense for a landowner to have to deal with the paperwork for what could be eight or more separate programs. And this is just the short list. Many are conflicting and redundant, virtually none are coordinated.

Representative English has introduced legislation that would enable farmers establish to a single conservation plan for their farms and ranches. The concept makes sense but should be expanded to apply to programs from EPA and other agencies as well. We urge that this Committee look carefully at what is already required and find ways to combine and consolidate efforts.

With regard to specific suggestions regarding the Sec. 319 program, Farm Bureau and other farm and ranch organizations have developed the attached Statement of Principles. We have met with Committee staff and look forward to working with you on this matter. (See attachment #4.)

○ ○ ○

In summary, we support the following concepts to address the issue of nonpoint source pollution:

- ✓ The central focus of NPS management solutions should be a reasonable and voluntary approach based on incentives, education, and site specific technical assistance. The nature of the problem differs substantially from that of point source pollution and hence requires different approaches. Best management plans and practices should allow maximum flexibility.
- ✓ NPS programs should retain the emphasis on State primacy and the development of locally designed, implemented and monitored best management practices.
- ✓ States should continue to have the authority to identify and resolve their priority water quality problems through administration of Sec. 319 funds.
- ✓ Management efforts funded by Sec. 319 money should be directed to priority watershed areas based on scientific assessments. Strategies should be developed on a watershed-wide basis.
- ✓ USDA and the Soil Conservation Service should have the primary role in developing plans and assisting landowners with implementation.
- ✓ Reauthorization of the Clean Water Act should include a strong financial commitment to further research, monitoring and assessment projects. More information is needed on the source, extent and impact of nonpoint source runoff, as well as the effectiveness, utility and economic feasibility of conservation practices.
- ✓ It is inappropriate for the Clean Water Act to extend citizens suit provisions to individuals participating in NPS management programs, nor is it appropriate to extend authority for citizen monitoring and oversight.

Our farmer and rancher members and other mainstream people realize that neither they, nor the nation, can afford the goals of zero pollution and zero risk when it comes to controlling soil erosion and agricultural runoff or any other human activity. However, they are willing to pursue excellence in conservation.

WETLAND POLICY REFORM

HISTORICAL PERSPECTIVE

For much of our history, wetlands have been viewed as a problem to be eliminated, rather than a resource to be managed and conserved. Wetlands were altered for purposes that provided many benefits to society, including flood control, protection of public health, agricultural production, road construction, government, education, and residential development.

Only recently has the emphasis shifted with a new focus on the unique and valuable functions of some wetlands in their natural state. This shift in public policy, and the view by some that wetlands are a "public" resource, does not always mesh with the fact that about 70 percent of wetlands are on private land, which individuals have purchased, mortgaged, and pay property taxes on. From an agricultural standpoint, one of the major shortcomings of the current wetland regulatory system is the failure to recognize and respect private property rights. Additional dry land and uplands have been swept into wetland categories by bureaucratic expansion.

A major part of the problem is that we have a wetlands program that grew not by design but by default, by bureaucratic expansion rather than congressional intent. In fact, the Clean Water Act does not even clearly and expressly direct the regulation of wetlands. Wetlands are not defined as "waters of the United States." Farmers and other natural resource users are now at the mercy of four federal agencies engaged in territory battles. Each has its own ideas about wetlands. None of them really cares what their decisions do to the livelihoods of landowners.

In less than 20 years, we have seen the Section 404 program go from regulating navigable waters, to regulating corn and soybean fields. Regulatory authority has expanded from restricting a few activities in the public waters of the United States, to federal planning and control without compensation. We have a regulatory policy that forsakes all other elements of ecosystems for wetlands. It rules blindly without weighing the importance of the wetland or the proposed project, the environmental value of the alternative site impacted, or for that matter, the cost to the property owners and the taxpayers. It is a policy that has required highway engineers to cut down, excavate and flood a mature maritime forest in Savannah, Georgia, in order to "compensate" for the minor wetlands lost during road-widening. It is a policy that for years has stifled local government officials in southeastern Virginia, where 80 percent of the land is hydric soils, from building a new drinking water reservoir for their residents. It is a policy that may cause a farmer to forfeit a third of his farm as "mitigation" because he could not afford the protracted legal costs of challenging the Corps of Engineers' allegation that his prior-converted cropland was still a wetland.

"Outside of Alaska, the majority-65 million acres of the nations wetlands are owned by the private sector--individual farmers, ranchers, corporations, land trusts, and other private landowners."
—National Wetlands Policy Forum

"The United States urgently needs a better system for protecting and managing its wetlands." —The National Wetlands Policy Forum

Over the last several years, this Committee has had numerous hearings on wetland policy. Witnesses have included farmers, businessmen, bankers, local government officials, concerned citizens, realtors, transportation personnel, members of Congress and even former regulators at the U.S. Army Corps of Engineers. Their message contained a singularly

consistent refrain: Something is terribly wrong with wetland regulations. The regulators have overreached, the regulations have no design or coordination, and there is a lack balance and perspective with other policy goals. This concern is real and widespread.

This Committee must not let the opportunity pass to improve wetland policy, from both the standpoint of the resource and the landowners.

WETLAND INVENTORY

There has been much attention given to the loss of wetlands over the years and the importance of conserving wetlands. Central to this debate is the need to understand the current rate of conversion of wetlands, as well as where and why those conversions are occurring.

Recently, the U.S. Department of Agriculture updated its National Resource Inventory (NRI) which covers the years 1982-1991. It represents the most recent survey of our wetland inventory and offers the most up-to-date picture of the wetlands alteration. The inventory examined the conversion of wetlands on non-federal rural land in the United States, excluding Alaska.

The NRI shows that the total wetland losses between 1982 and 1991 have trended down to approximately 110 thousand acres annually on non-federal rural lands. This includes alterations from agriculture, development and other categories such as drought, change to open water and acquisition by the federal government. Keep in mind that there are no new large-scale farmland clearing projects currently under way. The last large scale farmland clearings occurred when government inflation policy ran commodity prices to very high levels.

Of particular importance is the clear downward trend of these alterations. The alterations attributed to agriculture are particularly worth noting. They have declined to an average of less than 30,000 acres per year. Furthermore, the inventory does not attempt to estimate the amount of wetland acres created or restored by farmers and ranchers which we believe is significant. Nor would this account for the millions of acres of cropland which has fallen out of production over the last decade.

We believe agriculture already is contributing to sizeable additions to our nation's inventory of wetlands. We strongly recommend that the federal government adopt a standard method for inventorying wetlands, conduct a national inventory, classify these wetlands on the basis of function and value, and require that all government agencies adhere to this single inventory. We also suggest that before any federal inventory of wetlands is conducted, the Congress should adopt a clear, consistent and common-sense definition of wetlands to minimize confusion.

WETLAND DELINEATION MANUAL

For years, Farm Bureau has argued that there must be a common-sense definition of wetlands. Wetland delineation has been a major part of the problem, in large part because currently, wetland delineation equals wetland jurisdiction. Hence, by expanding the scope of wetland delineation as was the case in the 1989 manual, jurisdiction was also

expanded—without any public review or input, or any attempt to gauge the added regulatory impact on landowners, small business, property values, bank portfolios or local governments.

The fact that the National Academy of Sciences (NAS) is currently reviewing the several of the scientific aspects of wetland delineation should not preclude this Committee from addressing the policy reforms that are needed. The fundamental question is not the lack of science, but how to apply the science we have in a rational manner.

There has been abundant science incorporated in the 1987, 1989 and the 1991 draft version of the wetland manual. The controversy stems from the inescapable fact that under current law, everything that is deemed to have any wetland characteristics is subject to regulation, regardless of its functional value. Once regulated, there is no provision in law to classify high or low value wet soils and apportion protection efforts accordingly. Consequently, the coastal marsh, bogs, swamps and the damp area in the center of a corn field are both subject to jurisdiction. Similarly, the lack of any appeals procedure, increased regulation of landclearing activities, and a strengthening of the Sec. 404(f) provisions regarding normal farming activities all need to be addressed.

These specific concerns, as well as the overriding issue of what land ought to be regulated, are all outside of the scope of the National Academy of Sciences study. Any resolution of these problems will only come from the Congress and originate within the Public Works Committee. Reform of Sec. 404 must be part of the reauthorization of the Clean Water Act in 1993.

IMPACT ON AGRICULTURE

Farmers and ranchers, like many other small businesses, have been significantly impacted by the current wetland regulatory program. Many farmers have unwittingly found themselves ensnared in a regulatory trap that unnecessarily delays and frustrates all attempts at good-faith compliance and is prohibitively costly to challenge over a protracted period of time. In farming or ranching, the agricultural value of the land rarely justifies the cost of regulatory burdens, which can run into hundreds of thousands of dollars and many years. As a result, win or lose, the viability of the farming or ranching operation is placed in jeopardy. Wetland regulations have the net effect of reducing the value of productive assets by restricting current economic uses and limiting future use opportunities. The incidents are frequent, and costly and underscore the need for major reform.

From the perspective of farmers and ranchers, most of the problem stems from an excessively broad federal definition that encompasses land exhibiting few if any true wetland characteristics. Attempts to regulate so-called "dry wetlands" as they are known to environmental advocates, has led to many landowners, government officials, small businessmen and others becoming embroiled in costly conflict.

Regulation of these lands has caused property values to fall and tax burdens to shift dramatically, limiting the ability to obtain critical financing for farming operations. Dry wetlands designations also have precluded farmers and ranchers from physically expanding many types of farming operations, causing inefficiency and reduced competitiveness.

Despite a clear statement of intent from Congress in Section 404(f) that normal and routine farming and ranching practices are not subject to individual permit requirements, the opposite is often the case. Regulators who are anxious to expand their control and power over private landowners frequently cite normal and routine farming practices as needing a Section 404 permit. Such activities could be as innocuous as extending a milking parlor into a dry pasture, cleaning overgrown fence and hedgerows, cleaning and maintaining drainage ditches, construction of farm and stock ponds, maintaining center-pivot irrigation systems, building rice levees and catfish ponds, maintenance of levees, or brush clearing.

These are just a few of the types of normal and routine farming activities that our members have reported being cited by federal regulators as requiring federal permits. These frequent attempts to circumvent and narrow the intent of Congress under Sec. 404(f) actions are not benign and can result in costly legal disputes. Often, landowners are given an "opportunity for settlement" that usually includes a severe financial penalty and forfeiture of some land as mitigation over the so-called violation. In short, the issue comes down to vague law, and unintelligible regulations that have eroded credibility of the 404 program among landowners who are law-abiding people.

Land often is the farmer's only tangible asset after a lifetime of work. It represents his retirement, children's education, source of credit and overall financial well-being. To deny a landowner reasonable and full use of his property is wrong.

Clearly, we can and should do better. The challenge is to construct a coherent, national policy that protects the rights of property owners. Good policy is policy that the average citizen understands what we as a self-governing people are trying to accomplish. Today, not one citizen can tell you what we are trying to do with wetlands policy. It simply makes no economic or political sense at all.

While we have attempted to briefly illustrate the impact of that program on farmers and ranchers, we offer the following suggestions for correcting the problem. Those most pertinent to agriculture include the following:

1. Wetland Definitions

The temporary return to the 1987 Wetland manual is an improvement over the 1989 manual, but it too contains some of the uncertainties that led to the original controversy. The conflict over wetland delineation stems from the lack of a clear public policy to apply good science. In that context we look forward to the product of the National Academy of Sciences, but we do not view the NAS study as a panacea. As members of the House of Representatives, you, not the NAS, must be the arbiter of that conflict, the source of the compromise. Eighteen more months of study will not resolve it.

2. Prior Converted Cropland

The Environmental Protection Agency and Corps of Engineers has promulgated rules to exclude prior converted cropland from the scope of Section 404. This was an important change and we commend the Corps for their action. Prior converted croplands are defined as lands brought into agricultural production before December 23, 1985 (enactment date of the

Swampbuster provisions of the 1985 Food Security Act). They are lands that have been physically altered such as ditched, tilled, leveled or drained for the purpose of food production. They no longer function as wetlands, nor as the Corps indicated in a regulatory guidance letter of September 26, 1990, do they "show important wetland values." The 1985 farm bill specifically excludes prior converted cropland, and we believe that a similar exclusion should be carried through in Section 404.

3. Normal Farming Practices

Section 404(f) of the Clean Water Act intended for farms, ranches and forestry operations to continue "normal" farming and ranching activities including, but not limited to plowing, seeding, cultivating, minor drainage, harvesting etc., without having to obtain individual permits. Despite that intent, many of the conflicts between farmers and regulators are due to attempts by field office regulators with no familiarity with agriculture to define what constitutes a normal farming practice.

In Louisiana, Arkansas and Missouri, for example, regulators attempted to restrict the construction of rice levees as practices that were not exempt under Section 404(f) and that a 404 permit would be required, along with the need for mitigation. It should be noted that this land is dry and has been in crop production and crop rotations for decades. To grow rice, the water had to be diverted onto the land. Nevertheless, it took the personal intervention of five U.S. Senators and several months of effort to convince the Corps of Engineers of its error. Imagine, all of those resources spent to prove that this one activity involving only one commodity in one part of the country was a routine one. You can begin to understand why an individual farmer feels totally helpless and intimidated by this process.

Similar problems have occurred over the construction of catfish ponds, haying and grazing high mountain meadows, maintenance of drainage ditches, and many other routine practices.

We believe the intent of Congress is clear that these activities are to be exempt from permit requirements. Because of the diversity of agriculture among commodities and regions of the country, Congress should restate and further clarify that intent.

4. Classification of Wetlands

Changes to Section 404 should include a system of classifying wetlands, recognizing that not all wetlands share the same ecological value or perform the same functions. Those that are truly unique may be deserving of greater protection, whereas those that are marginal or only technically meet wetlands criteria should be subject to less stringent oversight.

5. Private Property Rights

Central to the wetlands issue is the question of private property rights. More than 70 percent of wetlands are on private property. The 5th Amendment to our Constitution provides that private property may not be taken for public use without payment or just compensation. Historically, the landowner has borne the burden of protecting this resource, both in the form of direct cost, as well as restricted use of property. We suggest that there is a public obligation to help shoulder these costs, since the public at large is the beneficiary.

6. Exclusion of Man-Made Wetlands

Many wetlands are created, intentionally or unintentionally, as a result of man's activities. Wetland vegetation as a result of crop irrigation, saturation from broken drain tiles, flooding as a result of neglected stream maintenance, standing water from poorly designed public works projects, and the construction of farm and stock ponds are examples.

These artificially created wetlands should not fall under 404 jurisdiction because they are man-made and often unintentional. Landowners should be encouraged to create wetland areas and the prospect of regulatory entanglement is not an incentive to that objective.

7. Soil Conservation Service Role

The USDA Soil Conservation Service should have a consolidated role in delineating wetlands on agricultural land. Currently they are responsible for delineating and enforcing the Swampbuster program. We strongly recommend that authority for delineation of all wetlands on agricultural land be the sole responsibility of the Soil Conservation Service. It would provide much needed consistency greatly reduce the conflict.

8. Compatible Wetland Crops

Under certain circumstances, some types of agricultural production are entirely compatible with conserving wetland functions and values. Forestry, cranberry production, haying/grazing and some types of aquaculture are prime examples. Where such commodities can be produced in manner consistent with overall wetland functions, they should be encouraged and allowed to expand.

9. Establish Appeals Process/Consolidate Enforcement

Another serious problem with the 404 program is the lack of any appeals process. There must be an equitable, efficient and inexpensive means for average landowners to appeal a delineation or a decision without going to court. Similarly, the dual enforcement of Sec. 404 by the Corps of Engineers and the Environmental Protection Agency needs to be consolidated.

We believe that the suggestions contained above will greatly improve the wetland regulatory program and reduce many of the inequities and difficulties faced by landowners and small businessmen. Many of these concepts are embodied in legislation currently introduced in the House of Representatives, H.R. 1330. We urge your support of this legislation.

“The National Wetlands Policy Forum strongly endorses the increased and coordinated use of compatible economic uses and other economic incentives to encourage landowners to manage, protect, restore and enhance the wetlands resources that they own.”
—The National Wetlands Policy Forum

Clean Water Act Funding Is Essential

The success of the efforts to address point source pollution is largely a result of the right tools coupled with the necessary resources to make it succeed. It is estimated that the total amount spent by the public and private sector to reduce point source pollution has cost more than \$160 billion over the last 20 years.

In our opinion, a similar and sustained commitment needs to be made if nonpoint source pollution is the priority that the Congress and the EPA say it is. While the diffuse nature of the problem requires a different policy approach, a commitment of financial resources and time are critical. Success will not occur without, in the case of agriculture, a cooperative approach that emphasizes technical assistance, grants and cost-sharing to the farm gate. It is a site-specific problem that requires site-specific solutions. All of the program building notwithstanding, nothing is gained in the form of improved water quality until something occurs on the ground. In some instances best management practices are simply too costly and represent an economic impediment to the landowner. Many small communities and small businesses faced the same kind of economic dilemma in coping with the point source requirements. As such, it will necessitate the same effort at developing creative and cooperative solutions.

One approach that we would strongly disagree with is a proposed tax on agricultural inputs. There is tremendous cost pressure on agriculture already to reduce the use and maximize the efficiency of agricultural production inputs. Little added benefit would be added by a so-called "green tax" on pesticides and nutrients. Conversely, the agricultural community is already financially strapped and it makes little sense to place further economic burdens on them that would further impede their ability to implement conservation practices.

We would encourage and assist any constructive and cooperative efforts to resolve the question of financing nonpoint source programs. The concept of extending the revolving loan fund or a version thereof, grants to local units of government, direct grants and/or cost-sharing, conservation credits on property or income taxes and market based approaches such as the trading concept all need to be thoroughly examined and considered. We look forward to working with you in this effort.

NATIONAL SUMMARY

MAJOR FSA PLANNED ENGINEERING PRACTICES

<u>PRACTICE</u>	<u>AMOUNT</u>	<u>STAFF YEARS</u>
Terraces	216,000 miles	3124
Grassed Waterway	1.3 million acres	2684
Structures	45,751 (No.)	592

AFBF's ENVIRONMENTAL EDUCATIONAL PROGRAMS

- 1983 Conservation Tillage Action Plan**
- 1984 Farm Partners: Have You Hugged Your Soil Lately?**
Includes Leader's Guide, 10 page workbook, & slide/tape show for a 1/2-day workshop on soil compaction, and residue cover.
- 1987 Water Quality Self-Help Checklist**
Now in its 7th edition with over 600,000 copies printed.
- 1988 Farmer Idea Exchange**
20 top ideas showcased every year at annual meeting, many relate to soil conservation, and more efficient use of fertilizer and crop protection chemicals.
- 1989 LISA Tours in IL, IN and OH-** (led by state Farm Bureaus)
- 1989 Cooperative Well Water Testing Program**
23 state FB's involved, over 40,000 wells tested, video tape available describing program.
- 1990 Cooperative Conservation Tillage Transect Survey** for use by county Farm Bureaus
- 1990 WQ- FB's Computerized Water Quality Self-Help Checklist**
- 1990 FB's Professional Self-Help Education Series**
Part I Agricultural Technology- 25 page booklet.
Part II Chemical Use- 26 page booklet.
Part III IPM- 33 page booklet.
- 1991 Crop Residue Placemats**
2800 camera ready slides distributed to state FBs-(one for each county FB.)
- 1991 Pesticide Recordkeeping Booklet**
ND, NB & KS Developed their own- AFBF distributed another 4,000 copies as a test.
- 1992 Innovation and Technology Transfer: What County Farm Bureaus Can Do**
Distributed 600 copies of this 80-page booklet outlining innovative conservation equipment, county programs and state laws to encourage its use, and public education programs that county FBs could use.
- 1992 RCWP Lessons Learned, Nonpoint Source Water Quality Project Checklist.**
Distributed over 2,000 copies of this 6-page white paper and checklist to key federal, state, and local water quality officials and legislators. The paper was coigned by AFBF, all state Farm Bureaus and 27 other major agriculturally related organizations.

CLEAN WATER ACT REAUTHORIZATION: NONPOINT SOURCE PROVISIONS

In the reauthorization of the Clean Water Act, Congress should adhere to the following principles:

1. The Clean Water Act (CWA) does not stand alone in protecting America's waters from nonpoint source (NPS) pollution. Other ongoing programs at the federal, state and local level must be funded fully, coordinated with and not superceded by the CWA. This includes, in particular, the soil conservation and water quality provisions of the 1985 and 1990 farm acts and the state groundwater and surface water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).
2. Recognizing the 20-year commitment our country has had to eliminating point-source pollution, success in reducing the more complex and diverse NPS pollution will require similar time and resource commitments. However, management of this problem will require a different approach than that of point source pollution elimination because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.
3. The central focus of NPS management solutions should be a reasonable and voluntary approach based on incentives, education and technical assistance as the primary means of managing NPS pollution.
 - NPS pollution management programs should (a) emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, and (b) recognize the importance and needs of individual agricultural producers and other landowners affected by the CWA.
 - This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights. Implementation of these farm management options over a realistic time frame will further the goal of reaching or maintaining designated uses of water bodies.
 - It is inappropriate to link USDA commodity, conservation or disaster program payments to the success or failure of management programs for NPS pollution authorized under the CWA.

4. Current CWA language contains valuable provisions for NPS management embodied in Section 319. Although this NPS section has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and approved management programs. Within the CWA, it is the preferable vehicle for management of NPS pollution, and changes which occur during CWA reauthorization should reinforce these existing NPS provisions.
 - The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local organizations should continue to carry out these NPS programs. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.
 - State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses.
5. Management efforts funded by Section 319 of the CWA should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses.
 - Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.
 - Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality.
 - Programs should focus on cost-effective, site-specific practices for individual operations with flexibility for implementation.
 - In order for Section 319 to work effectively for agriculture, USDA must play a lead role in the delivery of education and technical assistance at the state and local level.

6. An effective and cost-efficient response to water quality problems requires accurate and reliable information on (a) the source, extent, and impact of NPS pollution, as well as (b) the effectiveness, utility and economic feasibility of conservation measures and best management practices.
 - Any Clean Water Act reauthorization should include a strong financial commitment to further research, monitoring and assessment projects.
 - Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings.
 - Scientific research and monitoring projects should follow protocols developed by the U.S. Geological Service and should be conducted on a watershed basis with local and state input.
 - Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged.
7. The Clean Water Act Reauthorization should not directly or indirectly create a federal water quality law or program which supersedes, abrogates or impairs state water allocation systems and water rights.
8. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.
9. It is inappropriate for a reauthorization of the Clean Water Act to provide the authority for citizens suits against individuals participating in NPS management programs.

STATEMENT FOR THE RECORD
OF BETH NORCROSS
DIRECTOR OF LEGISLATIVE PROGRAMS
AMERICAN RIVERS, INC.

ON S. 1114
THE WATER POLLUTION PREVENTION
AND CONTROL ACT OF 1993

BEFORE THE SENATE ENVIRONMENT
AND PUBLIC WORKS COMMITTEE

SEPTEMBER 30, 1993

American Rivers appreciates the opportunity to provide testimony on S. 1114, the Water Pollution Prevention and Control Act of 1993. American Rivers is a 15,000-member conservation organization dedicated to the protection and restoration of our nation's rivers and streams.

We would like to begin by commending Senators Baucus and Chafee for the introduction of this far-reaching re-authorization of the Clean Water Act. While we do have some concerns with the bill as currently drafted, it goes a long way in addressing many of the major issues affecting the health of the country's waterways.

Our testimony will center around our belief that the Clean Water Act must recognize the most basic tenet of river science - a river system is an integrated whole with its health dependent on all aspects of its associated ecosystem. To meet its goal of protecting the "chemical, physical, and biological integrity of the Nation's waters" (emphasis added), the Act must address not only the chemical composition of the river system, but also the vitality of its headwaters and tributaries, its nearside riparian habitat, its channel structure, its flow regime, and the aquatic species composition associated with it.

While the chemical health of the nation's waterways has shown great progress since the passage of the Clean Water Act in 1972, unfortunately the biological health of our rivers and streams has declined precipitously. In the National Research Council's National Academy of Sciences' far-reaching report, *Restoration of Aquatic Ecosystems: Science, Technology, and Public Policy*, the authors point out that aquatic species are declining at a rate far greater than that of terrestrial species. Still other studies come to similarly bleak conclusions. Specifically:

- Riparian forests have been reduced by 66 percent. In Arizona, low-lying riparian habitat is merely 10% of its historic level.
- Thirty-four percent of North American fish species, 65% of crayfishes, and 75% percent of unionid mussels are classified as rare to extinct.
- Twenty percent of the native fishes of the Western United States are extinct or endangered.

- Since 1933, 20 percent of the mollusks (clams and their relatives) in the Tennessee River system have been lost, and 45 percent of the remaining species are endangered or seriously depleted.
- Since 1910, salmon runs on the Columbia River have declined by 75 to 85 percent. Over 200 wild Pacific salmon and steelhead stocks are currently at risk of extinction.

While the traditional emphasis on chemical criteria within the Clean Water Act may have improved the chemical quality of the nation's waters, it has been woefully inadequate in protecting the biological health of those same waters. Clean, "pure" water may meet chemical, water quality standards, but still be devoid of aquatic life. Unfortunately, efforts to "clean" our waters have not only not protected aquatic life, but in some cases have actually harmed it.

A specific example in Illinois tells the story best. A major thrust of the original 1972 Act was to encourage the expansion and development of wastewater treatment programs. The assumption built into most of these programs was that reductions in chemical loading will improve biological integrity as well. However, a study of the effects of wastewater treatment on three Illinois streams by Karr, Heidinger and Helmer¹ demonstrated quite a different result. The biological integrity of the streams -- species composition, predator relationships, food availability, flow regime, channel morphology, etc. -- was the highest upstream of the point where the "purified" wastewater treatment waters came in. Biological integrity was at its lowest at points immediately below the wastewater outfall. Furthermore, the fish community never fully recovered farther downstream from these efforts to "clean up" our streams.

In 1990, EPA issued a policy statement encouraging States to develop narrative biological criteria by 1993, and published a guidance document for States to use in developing biological criteria in their water quality programs, yet few States have complied. The State of Ohio, however, which has developed a model program for including biological criteria in its water quality program, is the exception. Some of the State's preliminary findings offer additional incentives for other

¹Karr, James R.; Heidinger, Roy C.; and Helmer, Eileen H.: "Effects of chlorine and ammonia from wastewater treatment facilities on biotic integrity," in *Journal Water Pollution Control Federation*, September 1985, 57:9, pp. 912-915.

States' to follow Ohio's lead: Studies conducted by the State concluded that 36 percent of recorded biological damage cannot be detected by traditional chemical criteria. Even more compelling, 50 percent of the impaired waters in Ohio would be misclassified as attaining Clean Water Act standards if biological damage was not considered.

BIOLOGICAL CRITERIA

Throughout the Clean Water Act, an effort must be made to broaden the thinking of the public, federal agencies, States, and Congress toward "pollution" and the protection of "water quality". While the 1987 amendments to the Act expanded the definition of pollution to include alteration of chemical, physical and biological stream features, the perception of pollution and the orientation of EPA implementation of the Act still leans heavily toward chemical considerations. Accordingly, we recommend the following changes:

- The Act could go a long way towards educating the public and policy makers regarding the biological health of our nation's waterways by universally changing the word "pollution" to "degradation" or "adverse activity", and replace "water quality" with "ecological health of the water resource".
- Section 303/304 water quality standards should be revised to require States to incorporate criteria related to ecological health in addition to those more traditional chemical criteria in state water quality standards. The States should also be required to meet such standards. Biological criteria should include the following:
 - habitat structure which includes channel morphology, water depth and velocity, spatial complexity of physical habitat;
 - flow regime which includes water volume and distribution;
 - energy sources which include type, amount and size of organic material entering stream, availability of food sources; and
 - biotic interactions which include competition, predation, disease, and parasitism²

²Karr, James R.: "Defining and assessing ecological integrity: Beyond water quality," *in Environmental Toxicology and Chemistry*, September 1993, 12:9, pp. 1-11.

- Section 305 relating to water quality monitoring should be revised to incorporate comprehensive, mandatory monitoring of the ecological health of a waterway, including the monitoring of the biological criteria listed above. The Index of Biotic Integrity (IBI) developed by Dr. James Karr in 1981 and used extensively in many areas could easily be used as a model biological monitoring program. The IBI includes 12 measures which compare the biological values (listed above) of a specific stream with those expected of a relatively pristine stream.

- Amend new section 402(e)(1)(A) (relating to the consultative role of the Fish and Wildlife Service and the National Marine Fisheries Service in the biological assessment of state permits) to require the consultation of such agencies. The bill is drafted would allow the Administrator to choose whether to consult or not.

Additionally, the consultative role of these agencies should go well beyond sensitive aquatic species and require consultation on the health of all aquatic species. While it is helpful to recognize aquatic species which are in trouble, a comprehensive aquatic gameplan could secure broad, ecological health of streams and prevent hundreds of future endangered species. Accordingly, section (a), which now prohibits permits on those discharges that affect a "balanced population of shellfish, fish, and wildlife," should be broadened to include "healthy populations of aquatic species" or to "maintain the biological integrity of river systems."

SECTION 401-STATE CONDITIONING AUTHORITY

Need for Clarification

In keeping with our belief that the Clean Water Act should address a broad range of aquatic health issues, we support section 602 of S. 1114, which reaffirms the States' ability to deny water quality certification to applicants for federally-licensed activities which adversely affect state water quality standards. This provision is particularly important to the States in controlling or stopping federally-licensed hydroelectric projects which would jeopardize fisheries, aquatic health, recreational activities and the like by altering stream temperature, velocity, turbidity and channel structure. We do, however, believe that this section should be broadened to clarify that state water quality certification can be used on a broad range of federal activities, consistent with new responsibility given the States in S. 1114.

The language in the bill makes clearer what is already explicit in section 401(a)(1), that in order to obtain certification, the applicant must be able to demonstrate that the permitted or licensed activity will comply with several provisions of the Clean Water Act, including section 303. Section 303, in turn, has provided since its inception that water quality standards "shall consist of the designated uses of the navigable waters Such standards shall be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and . . . other purposes" EPA's water quality standards regulations, in turn, require state water quality standards to be comprised of three separate parts: designated uses of the waters, which include all the uses set out in section 303 (including fisheries, recreation, etc.); criteria designed to achieve and maintain the uses; and an antidegradation provision which prohibits the degradation of any existing uses of the waters. 40 C.F.R. §131.10 - 131.12.

The reason for this clarification stems from challenges to the States' authority to condition the grant of certification in various ways designed to ensure that existing or designated uses would not be degraded, as required by federal law and regulation.

For instance, the Vermont Supreme Court has held that water quality certification could be conditioned on the provision of a certain amount of spill over a FERC licensed dam, both because without the spill, the State's dissolved oxygen standard would be violated, and because Vermont's water quality standards require that the waterway in question be managed for "water of a quality which consistently exhibits good aesthetic value . . . and recreation."³ The applicant, however, has kept the State in litigation over this condition for several years and has petitioned the Supreme Court for review of Vermont's highest court.

In another case from Washington State,⁴ although the waterway in question was designated for salmon spawning, rearing and migration, and the State's scientists found that a certain flow of water was necessary below the licensed dam in order to maintain that use in the river, the applicant has kept the State in litigation over that condition since 1986. And although Washington's highest court ruled unanimously that the instream

³ Georgia Pacific Corp. and Simpson Paper (Vermont) Co. Inc., Vt. Sup. Ct. No. 91-530, September 14, 1992.

⁴ Department of Ecology v. PUD No. 1 of Jefferson County, 121 Wash. 2d 179 (1993).

flow condition was not only allowed but necessary under federal law to prevent degradation of the existing uses of the waterway, the applicant is now seeking review by the U.S. Supreme Court. Over 200 stocks of salmon in the Pacific Northwest are at risk of extinction, including salmon in the river in this case. If the States cannot protect these designated uses, and have to engage in litigation for 10 years over each such condition, water quality certification is an empty shell.

The new provision of section 401 would also clarify that it is the activity which affects water quality standards that must be certified, and may be conditioned on state requirements that will ensure compliance with state water quality standards. The predecessor to section 401, Section 21(b) of the Water Quality Act, was clear in this regard. The substitute in S. 1112, that any such activity will so comply, merely clarifies that the discharge is not to be viewed in isolation from the licensed activity as a whole, as originally intended in Section 21(b) of the 1969 Water Quality Improvement Act, the almost verbatim predecessor to section 401(a).

When Congress amended the statute in establishing the original Clean Water Act in 1972 to state that "any such discharge will not violate [water quality standards]," it appears to have had no intention of altering the effect of the original provision. Rather, the legislative history makes several references to the revised section as being substantially the same as section 21(b), which Congress amended merely to assure consistency with the bill's changed emphasis from water quality standards to effluent limitations. Otherwise, the legislative history acknowledges only "minor" changes in the new provision.⁵

Any other interpretation works absurd results, which unfortunately have been advocated by applicants for certification in order to avoid complying with state water quality standards. For instance, in a case from a trial court in Pennsylvania, Pennsylvania Department of Environmental Resources v. City of Harrisburg, 578 A.2d 563 (Pa. Cmwlth. 1990), the court held that while Pennsylvania could evaluate the effects of a proposed dam licensed by the Federal Energy Regulatory Commission on downstream water quality, it could not evaluate the effects of the project upstream of the proposed dam. Thus, Pennsylvania was precluded from taking into account upstream effects of the proposed dam, even though it might degrade and indeed eliminate designated and existing uses of the waterway.

⁵ See, e.g., S. Rep. No. 414, 92d Cong., 1st Sess. 69 (1971); H.R. Rep. No. 911, 92d Cong., 2d Sess. 121-14, 165 (1972); 117 Cong. Rec. 38,857 (1971).

Moreover, the court also held that Pennsylvania was precluded from considering the biological and physical impacts of the project upon its waters. That result, too, is ludicrous in light of the States' authority to adopt water quality standards that protect and maintain state waters' chemical, biological and physical integrity and their designated and existing uses, and resulted from the court's cramped interpretation of the term "discharge" in section 401.

An expanded section 401

Section 401 has been a powerful tool for some States in their efforts to address a wide variety of threats to the ecological health of their waters. But inconsistent court rulings have frustrated the States and kept 401 from being the significant ally it should be. Moreover, section 401 is not explicit in granting authority to the States to control activities other than those considered point sources. Since S. 1112 gives additional new responsibility to the States in controlling polluted runoff, it is appropriate to give the States the wherewithal to limit federal activities which could severely threaten those objectives.

We, therefore, endorse the following amendment to section 602 revising the first sentence of section 401 as follows:

"Any applicant for a federal license or permit to conduct any activity, and any Federal agency proposing to conduct any activity or allow any activity on Federal land, including, but not limited to, the construction or operation of facilities, which may result in any discharge into or other alteration of the navigable waters, or any activity for which management measures are required under section 319, shall provide the licensing or permitting agency a certification from the State in which, or nearest to the point at which, the discharge originates or will originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the navigable waters [at the point] where the discharge originates or will originate, that the activity [any discharge] will comply with the applicable provisions of sections 301, 302, 303, 306, [and] 307, 402 and 319 [of this Act], and that any such activity will comply with water quality standards issued under section 303 and allow for the protection, achievement, and maintenance of designated uses included in such standards."

This expanded section 401 would achieve the following:

- Clarification that the States have the authority to set conditions on a broad range of federal activities which adversely

affect state water quality standards through both polluted runoff and point source discharges.

- Clarification that the States have the authority to set conditions on wetlands and other alteration of the physical structure of waterways.

- Clarification that the States have the authority to set conditions on federal activities which are outside their boundaries.

A memo is enclosed with this testimony which offers a more thorough description of the proposed section 401 amendment and the rationale behind it.

OUTSTANDING NATIONAL RESOURCE WATERS (ONRW)

We applaud the provisions in S. 1112 which require States to establish strong programs to protect their most pristine waterways. The lack of a clear, statutory mandate in the past has resulted in inconsistent policies and implementation of the ONRW program by EPA, and a mishmash of state programs, few of which really do the job. S. 1112 assures the protection of outstanding waters by directing each State to 1) develop a program to protect its outstanding waters within two years; 2) include all waters within certain federal designations, such as wilderness areas, national parks, and wild and scenic rivers; and 3) include within its antidegradation policy assurance that outstanding waters will meet water quality standards.

While S. 1112 goes a long way toward reaching the goal of protecting pristine waters, we do suggest two amendments:

- Paragraph (3)(B)(ii) which provides de facto ONRW protection for certain federally designated areas, including wild and scenic rivers, should be amended to include only "wild" and "scenic" classifications and exclude those rivers classified as "recreational." Designated wild and scenic rivers are classified either "wild," "scenic," or "recreational," based primarily on the amount of development along the stream. While most "wild" and "scenic" classified rivers enjoy pristine water quality, many of the "recreational" segments are developed and often run through urban areas, and may therefore not be suitable candidates for ONRW status. "Recreational" rivers should, however, retain the same opportunity to be classified as ONRW as other segments, but should not be automatically designated without further analysis and investigation by the State.

• Paragraph (3)(E) should be amended to require the State to protect the overall "ecological health of all outstanding national resource waters" not just for the "protection and propagation of a balanced population of fish, shellfish, and wildlife, and recreation" as currently in the bill. While we certainly support the protection of fish and wildlife, the ecological health of a river system is much broader than protecting specific uses. As noted earlier, ecological health of a stream includes not only chemical water quality, but habitat structure, flow regime, energy sources and biotic interactions. The nation's most pristine waters clearly should enjoy the highest and most complete level of protection available.

We appreciate this opportunity to submit testimony for the record and would be glad to answer any additional questions or provide clarification as necessary.

MEMORANDUM

TO: Mike Evans, Steve Schimberg, Bill Leary, Jeff Peterson,
Jimmie Powell

FROM: Bob Adler, NRDC
Bruce Carpenter, New York Rivers United
Katherine Ransel, Beth Norcross, American Rivers

RE: Section 401 provision of S.1114

DATE: September 28, 1993

Section 602 of S.1114, taken from a bill introduced by Senator Jeffords, would add to the end of the first sentence of section 401(a) the following: "... and that any such activity will comply with water quality standards adopted under section 303 and allow for the protection, attainment, and maintenance of designated uses included in the standards."

This language clarifies that states have the authority under section 401 to deny or condition water quality certifications based on use impairment, not just violations of chemical water quality parameters. We believe this is consistent with Congress' intent, and will help in a range of cases in which the authority of states to condition FERC licenses has been challenged.

We support this language as far as it goes. However, it does not address all of the problems with the current scope and judicial interpretation of section 401. We propose that the first sentence of 401 be revised more comprehensively, as follows:

Any applicant for a federal license or permit to conduct any activity, and any Federal agency proposing to conduct any activity or allow any activity on Federal land, including, but not limited to, the construction or operation of facilities, which may result in any discharge into or other alteration of the navigable waters, or any activity for which management measures are required under section 319, shall provide the licensing or permitting agency a certification from the State in which, or nearest to the point at which, the discharge originates or will originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the navigable waters (at the point) where the discharge originates or will originate, that the activity (any such discharge) will comply with the applicable provisions of sections 301, 302, 303, 306, [and] 307, 402 and 319 [of this Act], and that any such activity will comply with water quality standards issued under section 303 and allow for the protection, achievement, and maintenance of designated uses included in such standards.

The proposed language would clarify that:

1. Section 401 applies to the full range of federal activities that may affect state waters. S. 1114 would impose appropriate but significant new obligations on states to meet water quality standards by improving controls on polluted runoff and other sources. To meet this obligation, states should be given the legal tools to assure that activities on federal lands, including runoff from hydro projects, construction, logging, mining, grazing, etc., are properly addressed. Inequities could result if similar activities on state or private lands are required to impose stricter controls than on federal lands.

2. Section 401 applies to runoff as well as point source discharges. As noted above, states will be increasing their focus on land management practices that will reduce runoff impacts, in order to restore watersheds and meet water quality standards. This will clarify that states have the necessary authority to certify whether runoff impacts from federal activities will have unacceptable water quality impacts.

3. Section 401 is available to states whose waters are affected by a federal activity outside its boundaries. For example, Florida tried to certify that a federal offshore oil and gas lease sale (in federal waters) would cause violations of water quality standards within state waters. The Ninth Circuit ruled that Florida lacked the authority to issue a 401 certification with respect to activities occurring in federal waters, regardless of instate impacts. (This problem was addressed in a bill introduced by Senator Graham last Congress.)

4. Section 401 applies to wetlands fills and other physical alteration of water bodies. This would clarify that states have the authority to assist in wetlands protection through 401 certifications even if they choose not to assume program delegation.

We are seeking support for this proposal from ASIWPCA and NGA.

Background

Section 401 potentially can be an extremely potent tool for states in protecting the integrity of their waters. It gives states water quality control over a wide range of activities for which they otherwise might lack authority. Some states have used section 401 to admirable effect. For example:

- * Maine used section 401 to impose oil spill prevention as well as other water quality requirements on a proposed oil refinery and deep water terminal.¹

- * Massachusetts denied water quality certification for a Corps of Engineers' nationwide permit under section 404(e) of the Act (discussed below), requiring individual scrutiny for wetlands fills that otherwise would have been approved automatically.²
- * Washington conditioned its certification of a hydroelectric project on specific requirements designed to protect salmon.³
- * Oregon was allowed to condition water quality certification on land use restrictions, so long as it could show that those restrictions were necessary to ensure compliance with water quality standards.⁴

Unfortunately, there is no central source of information on the workings of this potentially powerful section of the Clean Water Act. For example, EPA indicated that no systematic information is maintained on state 401 programs, and worse yet, the issue is not even formally assigned to any single branch in EPA's Office of Water in Washington, D.C.⁵ The only agency rules on state water quality certification were issued in 1971, based on the statutory predecessor to section 401, and provide little guidance to states on substantive aspects of the program.

Moreover, while some courts have interpreted section 401 with appropriate breadth (examples of which are summarized above), others have narrowly constrained the activities states may review under section 401, and the types of concerns they may address in water quality certifications. For example:

- * A federal court in Pennsylvania ruled that section 401 certification was necessary only for the state in which the facility is located, not where the actual discharge is located.⁶
- * A federal appeals court agreed in a case involving offshore oil and gas drilling that states receiving the impacts of federally-licensed activities in federal waters (in this case Florida) have no authority to deny or condition water quality certification.⁷
- * A state court in Pennsylvania found that the State could not base its water quality certification on physical and biological impacts (such as impacts to wetlands and fish migration), but rather must be limited to chemical changes related to direct discharges of pollutants.⁸
- * Courts in New York State repeatedly have limited certification authority to violations of chemical water quality standards.⁹

These and other cases pose several serious problems. Many of the most serious impacts to aquatic resources are physical and biological, and not purely chemical in nature. States are just beginning to address these broader impacts in their water quality standards and monitoring programs, much less in their water quality certifications. If these courts are correct that states may only use section 401 to address chemical impairment, how can states protect the physical and biological integrity of their waters, as required by the Act? If fisheries and other aquatic resources are being destroyed by physical rather than chemical impacts, is it not artificial to limit states to tools that address chemical pollution? Since the courts are divided on this issue, the overall success of the 401 program may turn on Congressional clarification of state authority in this area.

Notes

1. Roosevelt Campobello Int'l Park Comm'n. v. EPA, 684 F.2d 1041 (1st Cir. 1982).

TESTIMONY OF DAVID S. BARON
ASSISTANT DIRECTOR, ARIZONA CENTER FOR LAW IN THE PUBLIC INTEREST
TO THE

SENATE COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS

ON

S. 1114: REAUTHORIZATION OF THE FEDERAL CLEAN WATER ACT

August 31, 1993

This testimony is offered on behalf of the Arizona Center for Law in the Public Interest, a nonprofit public interest law firm with offices in Phoenix and Tucson, Arizona. The Center has conducted litigation and advocacy under the Clean Water Act for more than a decade, representing environmental groups and conservationists. We have participated extensively in the adoption of state water quality standards, the development of NPDES permits for major dischargers, and the development of pretreatment programs in our largest cities. We have also filed a number of successful citizen suits to enforce NPDES permit provisions and other requirements of the Act.

The Center would like to respond to testimony presented to the Committee on August 4, 1993 by the Western Coalition of Arid States (WESTCAS). In that testimony, WESTCAS urges several radical changes in existing law and policy on water quality standards. Among other things, the group argues that the Act should only require water quality sufficient to protect wildlife that still survives in a river or lake - not species that would live there if water quality were restored to pre-pollution levels. In addition, WESTCAS asks for separate "western" water quality criteria that

would presumably be different (and weaker) than criteria for the rest of the country. These proposed changes are completely unjustified, and flatly contrary to the Act's basic goals of restoring the nation's waters and achieving fishable, swimmable quality throughout the country.

WESTCAS starts with the premise that many western rivers are ephemeral in nature, flowing only in response to major storm events. In a number of these rivers, the only flow for much of the year comes from municipal sewage effluent. The group then asserts that national water quality criteria are designed to protect species "that may not even exist" in such rivers. Finally, WESTCAS contends that it will cost "billions" of dollars to meet national water quality criteria in ephemeral streams, and that the benefit is not worth the cost.

The WESTCAS testimony is fundamentally flawed in a number of key respects. First of all, it is not correct to say that ephemeral streams in the West flow only in response to major storm events. Some of these rivers flow for many months during wet years, even in the absence of a single major storm event. Examples include segments of Arizona's Salt, Gila, and Santa Cruz rivers.

Second, the WESTCAS testimony misleadingly implies that current law requires the same water quality standards for ephemeral as perennial streams, even if the ephemeral stream has insufficient flow to support aquatic life. In reality, EPA regulations have long allowed states to set different standards for rivers with flows that are too low to support particular species. 40 C.F.R.

§131.10(g)(2). EPA also allows states to set water quality standards reflecting unique characteristics of a river's indigenous wildlife. Although EPA has adopted national criteria for protection of aquatic life, a state can vary from those criteria based on a showing that its native fishes are hardier (or less hardy) than those relied on by EPA. See 40 C.F.R. §131.11.

Third, there is no support for WESTCAS' doomsday prediction of billions of dollars in additional costs for municipalities to comply with existing law on water quality standards in ephemeral streams. Documentation for this claim does not appear in the group's testimony, and we believe it to be little more than shrill rhetoric. Similar claims were made two years ago by the City of Phoenix, when EPA proposed to adopt more stringent effluent limitations for the City's wastewater plants. The City asserted that it would cost \$100 million or more to meet new limits designed to protect wildlife and environmental values in the Salt and Gila rivers. EPA adopted the tougher limits anyway, and the City has in fact been able to meet all of them without spending additional funds beyond those it had intended to spend anyway on treatment plant improvements.

Typically, toxics are the pollutants of greatest concern with respect to protection of aquatic life and wildlife in ephemeral streams. This is because fish and wildlife are often affected by extremely low levels of toxic pollutants, necessitating strict standards to protect the ecosystem. But this does not mean that municipalities must install expensive treatment equipment to remove

toxics from their effluent. In most cases, toxics in municipal wastewater come primarily from industrial discharges to the sewer system. Cities can meet stream standards for toxics by requiring industries to remove these toxics before discharging to the sewer. Such pretreatment programs put the cost of cleanup where it belongs - on the responsible parties. Phoenix has been able to meet its new permit limits by upgrading its pretreatment program: No new treatment for toxics was required at the municipal wastewater plants.

We also oppose WESTCAS' call for separate water quality criteria for the arid west. EPA's national water quality criteria are based on representative species, and there is no evidence that western fish and wildlife are, as a class, markedly different from those relied on by EPA. Individual species found in the west may be more or less resistant to different pollutants, but current law already allows states to adopt standards that vary from the national criteria based on species-specific information. See U.S. EPA, Water Quality Standards Handbook at 4-2 (Dec. 1983). Current law also allows states to adapt national criteria to local conditions that affect the toxicity of specific pollutants. For example, the toxicity of metals to aquatic life often varies depending on the hardness of the water. EPA's national criteria for metals assume a certain level of hardness, but states can adjust the criteria based on the hardness of their own surface waters.

Thus, there is plenty of flexibility built in to the current

law to adopt standards that reflect unique local conditions. For this reason, we suspect that such concerns are not the true motivation for WESTCAS' position. Rather, WESTCAS is upset because effluent must ordinarily meet stream standards at the point of discharge when there is no other flow in the river. In contrast, facilities discharging into a flowing stream can usually establish a "mixing zone" in which their effluent is diluted by stream water before compliance with stream standards is measured. The nub of WESTCAS' complaint is that western municipalities that discharge into normally dry streams cannot claim any dilution credit from the stream itself, thus requiring them to meet more stringent pollution limits at the point of discharge than cities discharging into flowing streams.

The fact that stream standards may be harder for some cities to meet than others hardly justifies a separate set of water quality criteria for those cities. The purpose of the Clean Water Act is to protect the nation's rivers and lakes for wildlife, recreation, and other uses. The water quality standards necessary to protect those uses must be based on objective, scientific criteria - e.g., the level of a given toxic that presents a threat to fish, or the level of bacteria that threatens human health - not on how easy or hard it might be for a given discharger to reduce pollution levels. Carried to its logical conclusion, the WESTCAS position would require EPA to set different standards for literally every river and lake in the Country based on differing flow levels, wastestream composition, and cost of treatment technologies.

Moreover, the situation faced by cities discharging into dry rivers is neither as unfair or unique as WESTCAS implies. There are situations where a discharger into a flowing stream may have to meet limits as stringent or even more stringent than stream standards. This could happen, for example, where stream standards are already being violated and no further degradation can be allowed. Moreover, while some western cities do not have the "benefit" of perennial streams to dilute their wastewater, some of these cities have much less industrial waste to deal with than their eastern counterparts. Congress will find itself on a slippery slope indeed if it begins to set different water quality standards for different parts of the Country based on claims that it is harder for one region than another to reduce pollution.

We also do not agree with WESTCAS' proposal that biomonitoring be used only as a warning device and not as an enforcement tool. NPDES permits for large municipalities typically contain monitoring requirements and effluent limits for only a small fraction of the toxic pollutants discharged into the wastestream. Although there are an estimated 50,000 chemicals on the market, NPDES permits rarely address more than the 126 priority pollutants. Moreover, water quality criteria for individual pollutants do not ordinarily account for the synergistic or cumulative affects of multiple pollutants in a wastestream.

Biomonitoring addresses the above-described gaps in the current program. It forces municipalities to assess the real-world impact of complex waste streams on living organisms. But without

enforceable toxicity limits, such monitoring will likely turn into an empty exercise. A city that finds 0% survival of test organisms in its effluent will have little incentive to eliminate the cause if its only mandate is to conduct more testing. If the city is facing fines and other sanctions for such toxicity, however, it will have a powerful incentive to track down and eliminate the cause. It will also have a strong motivation to institute a serious pollution prevention program to reduce the discharge of all toxic wastes into the sewer system: clearly a highly desirable result.

In Arizona, NPDES permits for municipal wastewater plants in Phoenix, Tucson, and Nogales all have biomonitoring limits and enforceable toxicity limits. These limits have not produced undue hardship or difficulty - indeed, the cities are generally meeting the limits (although we believe the limits to be too lax). They have, however, forced the cities to take their pretreatment and pollution prevention programs far more seriously.

Finally, we fundamentally disagree with WESTCAS' suggestion that water quality standards should only protect "what is there" - i.e., species that still survive in an already polluted river. An original, and still laudable goal of the Clean Water Act is to restore the nation's waters. Many of the "dry" rivers cited by WESTCAS were once free flowing streams, rich in aquatic and riparian life. Their current state of desiccation is the result of human activity, including diversions to supply the very cities that now discharge effluent into them. The return of wastewater to

these rivers should not be viewed as a gift of grace from the discharging municipalities, but rather an obligation on the part of these cities to revitalize at least some of natural ecosystem that they have destroyed. In this light, stream standards for ephemeral and effluent dominated rivers should be sufficiently stringent to restore these waters, so that they can support a rich array of indigenous wildlife - not just species that have survived the onslaught of pollution.

WATERSHEDS

By

**Steve Tedder
Chief, North Carolina Water Quality Section
of the Division of Environmental Management**

August 1993

Mr. Chairman, Members of the Subcommittee, my name is Steve Tedder and I am the Chief of the Water Quality Section of the Division of Environmental Management for the State of North Carolina. I appear before you today as a representative of the fifty State Water program officials responsible for the implementation of the nation's Clean Water program.

As co-chair of the Watershed Work Group for the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), I am pleased to present this testimony and to introduce our Executive Director, Roberta Savage and our Deputy Director, Linda Eichmiller.

I am here today to endorse the concept of watershed protection, as a management tool to be used by State and Local governments. Watershed management is not program in the traditional bureaucratic sense. It is a philosophy and it is not new. As you indicated, Mr. Chairman, the creators of the 1972 Clean Water Act were keenly aware of the need to consider our waters in a holistic manner, to in essence, manage the water resource as a total system of surface and groundwater, point and nonpoint sources, quality and quantity.

Under Section 303 we were encouraged to plan basin-wide. In Section 208, we were to manage on an areawide basis. The concept is already embodied in statute and we in North Carolina, along with my colleagues in a number of other States, have made watershed management a reality with existing legislative authority. We do not need, nor will it be productive to initiate, major or extensive statutory reform to implement the "watershed philosophy." We certainly do not need to create an entirely new program or a new level of government to manage a philosophy. To be effective, the "watershed mentality" needs to be incorporated into the State "management mindset" as a way of doing daily business.

EXISTING CONGRESSIONAL WATERSHED DIRECTIVES

- Section 201 (c) - Areawide Treatment/Management
 - Section 208 (a) - Areawide Waste Treatment Plans
 - Section 208 (b) - Areawide Waste Treatment Management Planning
 - Section 303 (d) - Water Quality Standards/Priority Ranking of Waters
 - Section 303 (e) - Continuing Planning Process
 - Section 319 (a) - NPS Management Program
 - Section 319 (b) - NPS State Management Plans
-

At the Federal level we need to have willing counterparts who can be as creative, as we are eager, to implement this process. States need the latitude to:

Focus on priority water problems.

Focus staff and resources on those priorities.

Work with USEPA to eliminate unnecessary barriers and bean counting.

A word of caution is warranted as I begin my description of what we have determined to be a successful watershed process.

- 1) First, watershed management must be coordinated through the State agency. The concept will surely fail if the State regulatory agency and its many water related programs are not the pivotal focal point. This is not to say that Local governments, members of the public and/or constituent groups should not play a critical role. On the contrary, their involvement is essential to the overall success of any watershed approach. The simple fact, however, is that the Governor and the Executive Agency have the constitutional authority and responsibility to protect the health and welfare of the citizens of their State. Clearly, comprehensive water management falls within this jurisdiction. We can not have a multitude of entities going off in different directions inconsistent with Clean Water mandates.

- 2) As indicated, Local governments, the public, the farmers, the industries, the environmental community and other interested constituent groups have a critical role to play. Timing, however, is critical to the overall success of the "watershed philosophy." As we learned from 208, there is a major price to be paid if we halt programs and efforts underway to launch a massive national planning or public awareness campaign twenty years into the Clean Water Act. A massive "get involved now" movement orchestrated by the Federal government can serve only to breed unfulfilled expectations, public discontent and ultimately a less successful watershed protection process. This is particularly the case since there are no additional funds to carry out the water program.

Citizens will demand, and have every right to expect, that their investment of time in any governmental process, yields substantial and significant results. My point here is this, we do not want to ask the public to "get all dressed up" and excited about attending a party when what is needed is a new mindset on carrying out business. In some States the watershed process is well underway. In this instance, public involvement is critical now. In other States, the concept is just beginning to be considered and public involvement (outside the extensive existing channels) would be premature.

Having shared some of the generic concerns of the States, let me now focus on the concept of watershed protection and highlight for you just how North Carolina and other States have integrated programs to achieve a comprehensive plan.

WATERSHED APPROACH

Basin-wide water management enables States to develop comprehensive, long range management strategies to protect our nation's waters in an effective and consistent manner.

The watershed philosophy is becoming more popular with the States, because if properly utilized, it can serve as a cost cutting measure, it can focus limited staff resources on priority water problems and it can generate public interest in protection while continuing to enhance the waters of the State. Using the watershed process we have learned that:

- * States can rationally and cohesively incorporate: 1) chemical-specific monitoring and regulations; 2) bio-criteria, bio-assessments, and bio-surveys; 3) water quality modeling and planning; 4) whole effluent toxicity testing; 5) the NPDES program; 6) standards setting and

revision; 7) protection of public health and welfare; and 8) protection, restoration and management of natural resources, including wetlands.

.. It is the most effective way to integrate point and nonpoint source management.

- * Requirements of the Clean Water Act, USEPA regulation and State mandates can be met in an efficient and effective manner. We have identified, in essence, a method to assure that environmental protection activities can be coordinated and consistent.
 - .. Innovative management approaches can be more effectively utilized.
 - .. Sound economic growth and planning, coupled with equitable distribution of assimilative capacity, can usually be accommodated without degrading water quality.
 - .. Assessment and consideration of interactions among environmental stresses (e.g. cross-media, population, industrial and agricultural activities, etc.) can be more closely examined, and contributions from nonpoint sources can be addressed more explicitly.
- * The watershed targeting process enables States to realistically identify priorities. The framework facilitates development of water quality management strategies that achieve optimal environmental results.
- * Greater Statewide support can be generated when the public and interested constituent groups are actively involved in a water quality planning and management process that is more understandable.

**BASIN-WIDE/WATERSHED
ADVANTAGES**

- | | |
|------------------|---------------------------|
| • Efficiency | • Resource Management |
| • Effectiveness | • Public Involvement |
| • Consistency | • Adaptability |
| • Predictability | • Political Achievability |

If changes are made to the existing statute, the following principles should be incorporated.

1. To be successful, watershed protection must remain a voluntary management philosophy. Viewing it as another layer of requirements will not work. What States need are incentives to undertake what the Act has embodied since 1972.
2. State governments must continue to have full responsibility for managing water quality and quantity, as it relates to maintaining designated beneficial uses, etc. Regional, geologic and climatic conditions controlling water quality, availability and volume must be taken into consideration when developing a watershed approach. The Federal government must not mandate or restrict delegation of a particular State's water resources management authorities.

3. Institutional arrangements should be the prerogative of the State based on constitutional authorities, coupled with the unique legal, economic and social conditions in each State.
4. Flexibility should be available to accommodate Statewide basin management approaches. Including, but not limited to, Federal adjustments in:
 - a. Required outputs (and/or bean counting) including trade-offs or disinvestment from traditional requirements.
 - b. Timing of deadlines and categorical requirements in order to realign program operations to a watershed philosophy.
 - c. Traditional ("it is the way we've always done it") procedures.
5. USEPA oversight should be confined to a post audit procedure, which evaluates achievement of overall water quality objectives and existing statutory requirements, since their role is already extensive. USEPA should be encouraged to use existing institutions, States, Interstate Agencies and Local governments.
6. States recognize that public participation is essential. Innovative approaches, with emphasis placed on creating catalysts for State basin management activities, need to be created.
7. Pollution prevention and resource conservation should be incorporated as essential components of watershed protection.

Keys To Success

- **Consolidate Grants**
- **Consolidate Reporting**
- **Reduce Fragmented Clean Water Act Implementation**
- **Realistic Timetables**
- **Minimize and Consolidate Reporting**
- **Ten-year NPDES Permit/Extension Options**
- **Avoid "One Size Fits All"**
- **Allow State Flexibility**
- **Avoid Bureaucratic Hoops & Widgets**
- **Encourage the Concept/Do Not Mandate or Sanction**
- **Eliminate the Barriers/Do Not Create More**

SPECIFIC COMMENTS ON S. 1114

The Clean Water Act of 1972 was grounded in the concept of watershed management. In developing and implementing the multitude of policies and funding sources however, that go in different directions, the national program has lost sight of this fundamental philosophy. States appreciate the Senate's efforts to identify a mechanism to maximize environmental results. The timing is right to focus on the watershed approach and States have already taken the lead in doing just that.

It must, however, be emphasized that watershed management is not another layer of government or requirements -- it is a way of doing business. States currently involved in the watershed process

have created a strategic approach with no new money. This is possible only if it is indeed a philosophy and not a "new program." Incentives, however, do need to be addressed and impediments removed to accomplish the desired objective. In reauthorization, it is important that S. 1114:

- Encourage the watershed process of management to be fully achieved.
- Not undermine State efforts currently underway.
- Recognize State authority for water management.
- Allow, but not mandate, use of existing funding sources.
- Recognize that watershed management is an evolutionary or iterative process that will take years to fully achieve.
- Provide the necessary Federal flexibility to allow USEPA and the States to design a meaningful process to focus on priority water problems.

**How Does the Basin-wide Approach Differ From
the Existing Act?**

	<u>Previous</u>	<u>Basin-wide</u>
Permitting:	One at a time	Collective
Water Quality Studies:	Scattered	Focused
Nonpoint Source:	Independent from Point Source	Integrated TMDL Approach
Basin-wide Plan:	No	Yes

Consolidation

Senate Bill S. 1114 should allow States to consolidate existing requirements so that basins can be managed as a unit, under which existing programs are coordinated and decisions are made.

- The Bill needs to allow States to consolidate grants to effectively and efficiently develop and carry out watershed plans.
Currently, S. 1114 does not address such consolidation.
- The Bill needs to consolidate and create a realistic schedule for reporting requirements (e.g. 5 years).
Currently, S.1114 addresses this issue and States encourage additional emphasis in this area, with more consolidation.
- Both the point and nonpoint source programs should be embraced within the watershed concept.

S. 1114, in contrast, views the point and nonpoint source programs as separate command and control entities.

Requirements

To take a "one size fits all" approach will most certainly doom the watershed process to failure. To mandate "you must do it this way," undermines the integrity of existing State programs and actually discourages States from undertaking watershed management. Barriers must be eliminated, not created,

- **The watershed management process will take time to evolve and for this reason timeframes need to be realistic.**

S. 1114 deadlines and timetables are unachievable given the plethora of requirements incorporated in the existing statute. A streamlined or unified process for watershed protection is needed under which States have flexibility to achieve the multitude of mandates.

- **Program stability is essential to an effective Statewide process.**

States cannot proceed with watershed management, if at the same time, they are forced to make significant changes in water quality standards, as required by S. 1114. The environmental goal posts must be clearly identified at the outset for the concept to work.

- **States oppose the creation of a new layer of programs or requirements which would take away the incentive to proceed.**

S. 1114 treats watershed management as yet another program, in a bureaucratic and expensive exercise. There are no additional Federal funds and States are already deluged with too many requirements and deadlines. The watershed philosophy needs to be incorporated into the very fabric of State, Federal and Local government decision making to make rational use of the many programs already in place.

There is no need for more deadlines, gubernatorial designations, or USEPA approvals. This will only create new layers of oversight and second guessing. USEPA intrusion into State water management (e.g. surface and groundwater/quality and quantity) is inappropriate. Again, in order for States to accomplish what S. 1114 envisions, they need support encouragement, incentives and the elimination of bureaucratic barriers. The flexibility S. 1114 provides on permit terms is, for example, a very helpful move in that direction.

Mr. Chairman, we in the States commend you and your fine Staff for creating this informal forum for discussion of the watershed philosophy. We encourage you to remember that our mutual goal is the creation of a more effective Clean Water Act implementation process. If all we are about is design and implementation of yet another bureaucratic procedure of Federal command and control, this goal will remain unmet.

Again thank you for including our Association in this series of Clean Water Act Reauthorization hearings.

WRITTEN STATEMENT
OF THE
CHEMICAL MANUFACTURERS ASSOCIATION
BEFORE THE
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS
SUBCOMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE
UNITED STATES SENATE
REGARDING
S. 1114 - THE WATER POLLUTION PREVENTION AND CONTROL ACT OF 1993

AUGUST 16, 1993

EXECUTIVE SUMMARY

The Clean Water Act's controls on industrial point source discharges have been successful and will ensure continuing improvements to water quality. The additional requirements in S. 1114 imposed to control toxic pollutants from industrial point sources, however, will not produce significant reductions in risk to human health and the environment. Therefore, CMA does not believe these amendments are necessary or supportable.

Many of S. 1114's proposed changes in the name of pollution prevention are misguided. The bill's effluent guideline provisions and toxic pollutant phase-out provisions, in particular, are wrong approaches to pollution prevention.

Mandating source reduction practices, i.e. changes in production processes, products and raw materials, through the Clean Water Act's effluent guidelines, fails to recognize the complex nature of manufacturing and product development. This requirement would pose a serious threat to the competitiveness of U.S. manufacturing industries. Flexibility is key to effective source reduction because these decisions are extraordinarily site specific. Applying command and control techniques to achieve it will produce negative results. Further, requiring EPA to limit releases to other environmental media, to address "cross media" concerns will produce inconsistent requirements, not effective pollution prevention.

The toxic pollutant phase-out provision in S.1114 would replace EPA's current authority (Section 307(a)) to apply more stringent health-based toxic effluent standards (including prohibitions) for certain toxic pollutants, with a mandate to prohibit the discharge of newly listed pollutants. EPA's determination of which pollutants to list for phase-out would be based solely on a chemical's properties as highly toxic or toxic and highly bioaccumulative. The provision for listing these pollutants requires no demonstration of adverse effects to human health or the environment resulting from the discharge of the substance. A listing determination, then, would result in discharge prohibitions in the absence of a finding of unreasonable risk. Because these, in effect, would result in bans on the use of listed chemicals, they are extreme measures. Current EPA authority to apply more stringent controls is adequate and more appropriately balanced.

Voluntary pollution prevention planning is the most effective approach to achieving pollution prevention. However, the planning provision in this bill falls short. Its narrow definition of pollution prevention as reductions in use and byproduct generation and in-process recycling is overly restrictive. Its single media focus and its tie-in to NPDES permits are two other deficiencies that require correction.

CMA has a number of other concerns with this bill beyond these pollution prevention provisions. The bill's permit fee and effluent guideline fee provisions, for example, are inappropriate. While CMA supports permit fees to fund administration of the NPDES permit program, targeting these fees for other purposes is to ask permittees to pay for more than their fair share of the water program. The effluent guideline fee provision would give EPA a blank check to spend industry's money for developing guidelines and standards. There are no cost control/accountability mechanisms in either fee provision in this bill.

There is no rational reason for eliminating the Best Conventional Technology standards for conventional pollutants and its cost test. Current removal levels of conventional pollutants approaches 95% or more in most industries. The cost test correctly recognizes that pollution control costs steeply increase as pollutant removals reach these higher levels. The test ensures that additional controls be cost justified. Removing this test will promote technology for technology's sake, without any commensurate benefit to the environment.

The additional enforcement provisions in this bill are unnecessary. There is no need to expand citizen suit enforcement, no need to add natural resource damage authority to the Clean Water Act, and no need to impose multiple penalties as a result of single operational upsets. In addition, the Act currently provides for disqualification from government contracts in appropriate circumstances. To expand the contract bar to facilities that aren't "bad actors" is grossly unfair. Other unnecessary enforcement provisions in the bill are the field citation authority, the increase to the administrative penalty amounts, and the dictating of administrative penalty levels for the states.

Among CMA's other concerns with this bill are: the proposed changes to the domestic sewage exclusion; the presumptive applicability of federal water quality criteria as state water quality standards; the scheduled promulgation of sediment criteria before the science is fully developed; the designation of all waters as fishable/swimmable; the FIFRA and TSCA data requirements; the equivalence of pretreatment standards with BAT standards; the prohibition on control measures under effluent guidelines, NSPS, and pretreatment standards; the definition of new sources; and the compliance schedule amendment.

I. Introduction

The Chemical Manufacturers Association is pleased to submit this written statement on S. 1114, the Water Pollution Prevention and Control Act of 1993. CMA is a nonprofit trade association whose member companies represent more than 90 percent of the productive capacity of basic industrial chemicals in the United States. The chemical industry provides 1.1 million high technology, high wage jobs for American workers and consistently maintains positive trade balances. CMA's members are directly and significantly affected by the requirements of the Clean Water Act.

Two years ago, CMA testified before the Senate Environment and Public Works Committee on S.1081, the Water Pollution Prevention and Control Act of 1991. CMA is pleased to note that many of the concerns that we raised about S.1081 have been addressed in S. 1114. Overall, CMA believes that S. 1114 represents a more balanced approach for Clean Water Act reauthorization than S.1081. In particular, we commend the authors for including legislation that addresses watershed planning, nonpoint source pollution, and municipal pollution. Clearly, these areas provide the most significant opportunities for improving water quality and, therefore, should be the focal point of Clean Water Act reauthorization.

Nonetheless, we continue to have significant concerns about many of the S. 1114 provisions on toxic pollution, permitting and enforcement. We expressed some of our concerns about the toxic provisions in testimony we presented to the Senate Clean Water, Fisheries and Wildlife Subcommittee on July 1, 1993. Additional concerns about the enforcement provisions were highlighted in the statement we submitted to the Subcommittee for the record on the July 27, 1993 hearing on enforcement. These concerns, and others, are described in more detail below.

In general, CMA questions the need for Congress to enact extensive new requirements for industry. According to EPA, regulatory controls

on industrial point sources have succeeded in achieving large reductions in pollutants discharged to waters of the United States. When the Clean Water Act was first enacted in 1972, industrial discharges were considered a major cause of water quality impairment. Two years ago when CMA testified before the Senate Environment and Public Works Committee, we quoted EPA's National Water Quality Inventory -- 1988 Report to Congress -- to the effect that less than 15 percent of the remaining water quality problems could be attributed to industrial discharges. In EPA's 1990 Report to Congress, the data are even better: less than 10 percent of the remaining water quality problems were attributed to industrial discharges.

While it would be wrong for industry to use these statistics to claim its work is done, CMA believes it is appropriate to cite these data to support our belief that the Clean Water Act controls on industrial discharges have been successful and will ensure continuing improvements to water quality. The trend revealed by these data do not suggest that more controls on industrial discharges are needed. Instead, they suggest that existing controls on industry are effecting continuing improvements.

In light of these data, we question whether the additional requirements on industry that are proposed in S. 1114 will produce significant reductions in risk to human health and the environment. Likewise, we question whether these requirements will produce environmental benefits worth the cost or whether they will simply disrupt the current regulatory scheme. Finally, we strongly question whether our nation's increasingly limited resources could be better spent on other water quality and environmental problems where the risks are more significant.

As this subcommittee considers revisions to S. 1114, CMA urges it to focus its reauthorization efforts on the remaining significant water quality problems. It is our view that layering more regulation on the industrial community would produce little if any significant environmental benefit.

Following are CMA's specific comments and recommendations on selected provisions in S. 1114 which are of major concern to our industry.

II. Effluent Guidelines (Section 201)

A. Mandating Source Reduction Practices Through Effluent Guidelines Is An Inflexible, Ineffective Approach To Pollution Prevention

Under the current Clean Water Act, EPA develops technology-based controls that represent the level of pollutant removal, on an industry by industry basis, that the best technology is capable of achieving. In identifying what these best technology-based pollutant removal levels are, EPA considers treatment techniques, process innovations and operating methods. (See Section 304(b) of the Clean Water Act.)

In contrast to this current authority, Sections 201(a), (b) and (c) of S. 1114 would mandate EPA, in its development of BAT standards, New Source Performance Standards, and Pretreatment Standards, to "rely on, and require, to the maximum extent practicable, source reduction measures and practices, including changes in production processes, products and raw materials. . .". This language significantly expands EPA's current authority in developing BAT standards to consider process changes, along with treatment techniques, etc.. It expands EPA's authority by mandating that EPA require process changes, as well as product changes and raw material changes, in any given industry effluent guideline. This drastically changes the current performance-based nature of the effluent guidelines under which EPA can base end of pipe standards on control techniques and process changes but EPA cannot require industry to adopt these controls or process changes to meet these limitations.

This provision is an inefficient, inflexible and inappropriate approach to pollution prevention. By focusing on source reduction practices only, it limits EPA's ability to set standards based on recycling and treatment techniques. Its focus on source reduction also wholly disregards the complex nature of manufacturing and product development. There are literally thousands of manufacturing processes in use in American industry today. The chemical industry alone uses hundreds of unique operations. End-of-pipe standards that require raw material substitution or process modifications cannot adequately

reflect these variables. At a minimum, they would inhibit industry's ongoing development of innovative and cost effective pollution prevention technologies and techniques.

The focus on products and raw materials through the Clean Water Act is unprecedented and would pose a serious threat to the competitiveness of U.S. manufacturing industries. Requiring EPA to require changes in production processes, products and raw materials could result in the discontinued use of effective manufacturing processes, in the phase-out of many beneficial products, and in the significant impairment of the quality of other products. The effect would be minimal environmental protection, but at huge cost and competitive disadvantage to industry generally, as well as a loss of jobs throughout the economy.

While EPA may view this provision as supporting its development of effluent guidelines for establishment of "in-plant" limits, this provision goes well beyond what authority EPA might need in that regard. This language creates a mandate for source reduction effluent guidelines. If EPA doesn't follow this mandate in its development of effluent guidelines for all industries, EPA will be sued to do so because EPA does not have discretion to apply this requirement only "as appropriate".

Attempting to force-fit source reduction into the effluent guidelines process is a mismatch. Flexibility is crucial to effective source reduction because source reductions decisions are not, and cannot be made to be, "one size fits all". The extraordinary variety and complexity of manufacturing processes and products should suggest that an across the board attempt to force a single process, product or raw material change on an industry will have disastrous effects. Changes to processes, products and raw materials are extraordinarily site specific.

Industry already recognizes the bottom-line intelligence of pollution prevention. Industry already analyzes its processes, raw

materials and products to determine how best to prevent pollution in order to meet CWA effluent limits. It invests much time and money to do so. In this process, industry also considers the viability of recycling techniques and upgrades to treatment as a means of preventing pollution. All of these pollution prevention decisions are constrained by technological feasibility, economics, and product quality. Decisions about source reduction practices are particularly site specific. Even simple changes in the suppliers of raw materials require detailed evaluations of the material's effects through all the process steps and downstream markets. Process and product changes also raise the question of the interrelationship with other product control laws (e.g., FIFRA and TSCA). In short, pollution prevention decisions are not simple determinations that EPA can make effectively for industries through the Clean Water Act's effluent guidelines.

Further, the EPA resources required to develop these standards would be considerable. Development of industry-by-industry end-of-pipe standards that could even moderately reflect, much less require, best available production processes, products and raw materials within industries, would be prohibitively resource intensive given the enormous complexities involved.

Rather than trying to force-fit source reduction concepts into the effluent guideline process, Congress should develop incentives to further encourage industry to perform pollution prevention analyses that include source reduction. Planning for pollution prevention, under the public eye, is a more effective approach to promoting pollution prevention than having EPA try to command and control it on a single media basis. Public pressure would encourage pollution prevention. In contrast, pollution prevention "standards" would stifle innovation and thus discourage pollution prevention.

B. Mandating Establishment Of Cross-Media Standards Under The Clean Water Act Will Produce Inconsistent Requirements

In developing technology-based controls for direct dischargers under the CWA, EPA must specify certain factors to be "taken into account" in determining the best technology for achieving pollutant removal. Among the factors that EPA must consider are a technology's "non-water quality environmental impact". Under current law, therefore, EPA can select one technology as BAT on the basis that another technology creates too much "non water quality environmental impact." Impacts on other environmental media, therefore, are factored into EPA's assessment of the best control practices when developing the technology-based effluent guidelines for an industry.

Section 201(a), (b) and (c) of this bill would require that BAT standards, new source performance standards and pretreatment standards "prohibit or limit" the release of pollutants to other environmental media, including ground water. This provision converts EPA's current authority to consider cross media impacts into a mandatory requirement to establish CWA effluent guidelines for releases to air, land and ground water.

This amendment attempts to force-fit cross-media concerns into the Clean Water Act's effluent guideline process without any thought about the effect of such a requirement on other program requirements that regulate these other media. For example, the Clean Air Act and RCRA are specifically tailored to address and control releases to air, land and ground water. The criteria that drive EPA's development of technology-based standards under these other statutes are not identical to the criteria that drive EPA's development of CWA effluent guidelines. The creation of cross-media based effluent guidelines, therefore, could produce CWA requirements that prove inconsistent with the requirements of these other single media statutes. The result would first be confusion about which standard controls, followed by litigation, followed by a unsatisfactory band-aid solution. Trying to

convert already complex single media statutes into cross media statutes through this simple legislative "fix" is unworkable.

Further, this amendment is not necessary. EPA is embarking administratively in the direction of cross media considerations through its new cluster approach to regulation. EPA is reviewing and revising in concert the requirements imposed on specific industries by the single media statutes. It is doing this without creating new, potentially inconsistent multi-media standards.

In addition, this provision's specific call for effluent guidelines for ground water (coupled with other provisions in the bill for federal ground water criteria and presumptive applicability of federal criteria as state water quality standards) raises serious concerns about federal usurpation of states' primary authority to protect ground water resources. When Congress first considered the Clean Water Act in the early 1970's, several bills provided authority to establish federal standards for ground water. Congress rejected this notion, however, because of the complexity and variety of the states' jurisdiction regarding ground water. Primary jurisdiction over ground water quality and quantity has resided with the states and should continue to reside with the states because ground water resources vary significantly in quality, quantity, ease of obtaining and potential for contamination according to hydrogeologic conditions that vary across the country. State standards can more appropriately reflect these variations in local conditions and use patterns than federal standards could do.

C. Prohibitions On Control Measures Would Discourage Innovation

Under the current CWA, industry is not required to use the control technology identified by EPA as best available technology (BAT), as long as it meets the effluent standard that's based on BAT. Similarly, industry is not prohibited from using specific control technologies. The performance based approach of the effluent guidelines encourages

the development of new treatment technologies and innovative, less costly approaches to pollution prevention.

In response to some claims that certain control technologies have created cross media problems, Section 201 of this bill would give EPA authority to prohibit industry's use of certain technologies in meeting CWA standards where these technologies are determined to have an adverse impact on any environmental medium.

While the intention of this provision -- to avoid creation of cross media problems -- is sound, it is not worth the price that would have to be paid in terms of industry innovation. This amendment would have a chilling effect on development of innovative pollution prevention technologies.

If cross-media transfers are a problem, other environmental statutes should be used to control these other releases. To this end, EPA's cluster approach to regulation, again, should be helpful. Other recent developments in environmental regulation -- e.g., reporting requirements under EPCRA Section 313 -- are also discouraging cross media transfers. Congress should consider these other factors before taking this drastic approach to addressing cross-media concerns.

D. Elimination Of BCT And The Cost Test In Development Of Standards For Conventional Pollutants Will Promote Technology For Technology's Sake Without Any Rational Relationship To Environmental Benefits

The current Act applies a "cost reasonableness" test to the development of Best Conventional Technology (BCT) standards for conventional pollutants. S. 1114 eliminates the differentiation of treatment standards between conventional and toxic pollutants -- applying Best Available Technology standards to both -- and with this change, removes the BCT cost reasonableness test. This is inappropriate.

When Congress reviewed the Clean Water Act in 1977, it was presented with substantial evidence that compliance with BPT limits by

1977 had been very effective in treating conventional pollutants such as BOD and suspended solids. It was Congress' judgment that, from that point forward, additional investment in conventional pollutant control would have to be cost justified. Congress therefore adopted in 1977 the BCT level of pollution control technology which included a cost test. This cost test was developed in recognition of the fact that pollution control costs steeply increase as pollutant removals reach higher levels. Under BCT, additional controls on conventional pollutants beyond BPT could be imposed only to the extent that the increased cost of treatment would be reasonable in terms of the degree of environmental benefits.

Removing the BCT standard, and with it its cost test, makes no sense when conventional pollutant removal levels in most industries now approach 95% or above. This amendment promotes technology for technology's sake, without any rational relationship to the environmental benefits that will accrue. Therefore, this amendment should be eliminated.

E. Pretreatment Standards Equivalent To Direct Dischargers' Standards Ignores Congress' Concerns About Redundant Treatment

Section 201(c) of this bill requires that pretreatment standards be "no less stringent than any effluent guideline" for the same source category under Section 304(b) of the CWA. This amendment effectively imposes the same standards for indirect dischargers as for direct dischargers. The impact of this amendment is that industrial users of POTWs would be forced to install unnecessary, redundant treatment in order to meet pretreatment standards that are as stringent as direct discharge standards.

This amendment contrasts sharply with Congress' original intentions with respect to pretreatment standards. Under currently developed pretreatment standards, pollutants are treated twice, first by industry and then by a POTW which must comply with its permit. EPA's pretreatment standards are technology-based requirements based on the best available technology for specific industry categories. Congress

never intended these standards to require redundant treatment by industry. The legislative history of Section 307(b) of the Act makes it clear that pretreatment was not intended to be required as a substitute for adequate treatment by municipal waste treatment works. Under Section 307(b)(1) of the Act, EPA may only require pretreatment "for those pollutants which are determined not to be susceptible to treatment by POTWs or which would interfere with the operation of such treatment works." EPA makes determinations of whether pollutants are "incompatible" with POTWs based on criteria of interference, pass through, sludge contamination or other incompatible effects. In sum, Congress' intent was that the treatment capability and performance of the POTW be recognized and taken into account in establishing pretreatment standards.

This amendment ignores Congress' concerns about redundant treatment. This amendment is based on the erroneous premise that POTWs are not capable of effectively treating industrial effluent. In fact, POTWs use the same treatment technology as industrial wastewater treatment plants, and in many cases, POTWs were specifically designed and built to handle industrial wastewater. POTWs can and do provide effective treatment of conventional, non-conventional and toxic pollutants in industrial wastewater. Where a POTW is unable to handle specific industrial wastewaters, the POTW has authority to require their industrial users to meet local limits to enable the POTW to effectively treat those wastewaters. Any isolated examples of POTWs ill-equipped to handle industrial wastewater should not be used to justify making pretreatment standards for indirect dischargers equivalent to BAT standards for direct dischargers.

Proponents of this provision also argue that a significant portion of industrial wastewater that is sent to POTWs is released to the environment due to losses from leaking sewer lines. This claim is unsubstantiated. In fact, operators report more problems with infiltration into sewer lines than with exfiltration.

It was economies of scale that first brought about the idea of industries using POTWs to treat some of their wastewaters. In fact, industry helped fund the construction of many POTWs around the country and provides a significant source of revenue for POTW operation in many locations. If indirect dischargers are now required to meet the same standards that direct dischargers must meet, the advantages of these economies of scale will be greatly reduced. Additional, costly and redundant treatment will be required for no environmental benefit. Many indirect dischargers will seriously question the continuation of any tie-in to POTWS. Because industries that discharge to POTWS pay large user fees to these POTWS, another impact of this amendment could be a significant loss of revenue for the POTWS.

In sum, this amendment is unnecessary and will result in only significant increased costs for no environmental benefit.

F. S. 1114 Would Give EPA A Blank Check To Spend Industry's Money On Development Of Effluent Guidelines And Standards

Under the current Clean Water Act, EPA is required to develop effluent guidelines, new source performance standards, and pretreatment standards for categories of sources. Government funding is used to pay for these standard setting activities.

Under S. 1114, EPA would be required to determine the cost to the Agency of developing effluent guidelines, new source performance standards, and pretreatment standards. EPA would further be required to collect fees from facilities that are regulated under these guidelines and standards to offset the full costs of their development. Waivers would be available for small businesses or facilities for which fees would pose an unreasonable financial hardship. Fees may also be modified for facilities that demonstrate new or innovative technology.

Industry should not have to pay for development of guidelines or standards. That is properly a government funded function.

S. 1114 would give EPA a blank check to spend industry's money for developing guidelines and standards. There is no cost control mechanism under this provision. There would be no incentive for the Agency to be cost-effective in the development of guidelines and standards since they would be authorized to offset their full cost through collection of fees from industry. The cost burden would be particularly high on industrial users of POTWs since their individual discharges are relatively small while the cost of standard development is high. For all of these reasons, the effluent guidelines fee provision should be dropped.

G. Other Provisions In Section 201 Of S. 1114 Are Unnecessary And Should Be Dropped

1. New Source Definition

The revision to the effective date of New Source Performance Standards at Section 201(b)(2) of the bill is unnecessary. Under the current CWA regulations, a new source is defined as any source the construction of which begins either after the promulgation of a new source performance standard, or after proposal of such a standard, if the standard is subsequently promulgated within 120 days of its proposal in accordance with Section 306 of the Act. This regulation is reasonable and was upheld by the D.C. Circuit.

S. 1114's requirement that new source performance standards (NSPS) become effective on the date of proposal of the standard will create absurd results. For example, under this language, an organic chemicals plant which began construction in 1983 would have been subject to the NSPS under the OCPSF effluent guidelines that weren't promulgated until November 1987, more than four years later. While the intention of this amendment is grounded in the fear that industries will run out to build facilities as soon as NSPS are proposed so as to avoid their applicability, this has not been common practice. Further, applying proposed New Source Performance Standards that may be changed in the final rule (typically promulgated years later), is simply inequitable.

2. Compliance Schedules

The conforming amendment in Section 201(d)(1)(B) appears to preclude a compliance schedule for new water quality-based pollutant limitations if the permit already includes a limitation for those pollutants. This amendment is unnecessarily restrictive because it prohibits EPA from allowing reasonable opportunities to attain compliance where it is appropriate. Requiring newly negotiated water quality-based permit limits to become effective immediately, without allowing any time for compliance, is unrealistic. It fails to recognize that water quality-based permit limits are by definition more stringent than the technology-based limits that may have previously applied to these same pollutants. If the Clean Water Act's 1977 statutory deadlines for compliance with more stringent water quality based limits is what's prompting this amendment, this deadline should be changed to recognize the need for reasonable compliance schedules for new permit limits, whether based on new effluent guidelines or water quality standards.

III. Water Quality Criteria and Standards (Section 202)A. S. 1114 Would Shift Too Much Authority Away From The States To EPA For Setting Water Quality Standards

Under Section 303(c) of the current Clean Water Act, States are required to adopt water quality standards for waters in their State. These water quality standards consist of two elements: 1) a designated use or uses for each water body, e.g., public water supply, recreation, propagation of fish and wildlife; and 2) criteria necessary to protect the designated uses. State programs also contain antidegradation policies and specific implementation procedures to maintain and protect water quality.

States must adopt water quality standards for all priority pollutants, the discharge or presence of which "could reasonably be expected to interfere with" designated uses in the State. EPA's role is to develop water quality criteria for use by the States in developing their standards and to review State standards to determine if they meet requirements of the Clean Water Act. Section 303(c)(4) of the Clean Water Act grants authority to EPA to propose and promulgate water quality standards for a State if it finds that a standard developed by the State does not meet the applicable requirements of the Clean Water Act or at any other time when it determines that a standard is necessary.

Under the approach proposed in S. 1114, all waters for which a use has not been designated by a State would automatically be designated as fishable and swimmable. Further, S. 1114 provides that any water quality criterion published by EPA is to apply automatically to a State unless the State objects within 120 days and subsequently adopts its own criterion within 3 years. Finally, S. 1114 authorizes EPA to promulgate and implement an antidegradation policy and implementation procedures for States without an approved policy and procedures.

The provisions in S. 1114 would shift too much authority away from the States to EPA in setting water quality standards. Because States

can take into account local characteristics and uses (existing and future) of the water body, they are in the best position to determine appropriate designated uses for water bodies within their boundaries. Likewise, States are the appropriate government body to determine when water quality criteria are needed to support designated uses within the State. And, States should be allowed to adopt antidegradation policies and implementation procedures that meet the individual needs of that State.

For these reasons, States should be given ample opportunity to set all elements of their water quality programs for waters within their State. EPA should be allowed to set water quality standards for States only after States have had adequate opportunity to adopt their own standards. The current Clean Water Act recognizes this need. It provides EPA authority to impose water quality standards when State standards do not meet the requirements of the Clean Water Act or at any other time that a standard is necessary. This authority is sufficient to allow EPA to set water quality standards for a State, when necessary.

1. Use designations

S. 1114 provides that "all waters of the United States for which a use has not been designated shall be deemed to be designated as fishable and swimmable, unless a State establishes an alternative use for the waters." This automatic classification would take effect within 5 years of enactment.

The current Clean Water Act correctly recognizes other beneficial uses such as agricultural, industrial, and navigation. EPA's own regulations (40 CFR Part 131) stress the need for States to designate uses that are attainable. In some cases, a designated use of fishable/swimmable will simply be unattainable, due to natural background conditions or other factors. The approach in S. 1114 disregards this fact. In the event that EPA must establish use designations for a water in a State, it should also consider whether a

particular use designation is attainable. The automatic presumption that all unclassified waters can attain a use designation of fishable/swimmable in S. 1114 is therefore inappropriate.

2. Water quality criteria

Under S. 1114, each Federal water quality criterion that is published will become automatically a State criterion after only 120 days. S. 1114 would allow a State to object to this automatic application of the Federal criterion only if the State makes this objection within the 120 days and subsequently adopts its own criterion within 3 years.

This approach represents a major shift in current policy under which States have primary authority for adopting water quality criteria. Under the approach, States would have only limited discretion in adopting water quality criteria for the waters within its State. Section 303(c)(2)(B) of the Clean Water Act requires States to adopt criteria for toxic pollutants, "the discharge or presence of which . . . could reasonably be expected to interfere with designated uses" The approach in S. 1114 would skip this determination altogether, by making Federal criteria the presumptive State criteria regardless of whether a pollutant can reasonably be expected to interfere with designated uses in a particular State. States would have no opportunity to determine that a criterion is not needed in its State and only limited opportunity to determine if a different criterion than the Federal criterion would be more appropriate for the waters in its State. Furthermore, once a Federal criterion is automatically applied to a State (after 120 days), S. 1114 would provide no mechanism for a State to adopt its own criterion or modify the criterion at a later date.

Imposing Federal water quality criteria on States in this way will significantly restrict the ability of State permit writers to take into account local, site-specific conditions when developing water quality based permit limits. This is an important feature of many current

State water quality standards programs which should be retained and encouraged. By taking into account local, site-specific conditions, water quality based permit limits can be established for NPDES permittees that are protective of human health and aquatic life for a given location, without being unnecessarily overly protective.

3. Antidegradation Policy and Implementation Procedures

EPA regulations (40 CFR 131) require States to adopt an antidegradation policy and implementation procedures as part of its water quality standards. S. 1114 would codify this requirement. Further, it would provide EPA authority to promulgate an antidegradation policy for States without an approved policy within 3 years of enactment of S. 1114.

States should be given ample opportunity to develop and implement their own antidegradation policies. These policies specify how a State considers social and economic impacts in decisions to permit new or expanded manufacturing facilities as well as in decisions for outstanding natural resource water designations. Clearly, policies for these important considerations are most appropriately developed and implemented at the State level. Giving EPA authority to impose these considerations on States without their participation would be inappropriate.

In summary, the provisions in S. 1114 described above are not only inappropriate, they are unnecessary. Under the current Clean Water Act, EPA already has ample authority to establish water quality standards for States when EPA determines that standards are necessary in a State. EPA recently exercised this authority under the National Toxics Rule (57 Fed.Reg. 60848, Dec. 22, 1992).

B. Requirements In S. 1114 For EPA To Develop A Minimum Of 8 Sediment Criteria Within 4 Years Is Impractical And Contrary To Sound Science

Under the current Clean Water Act, EPA has authority to publish criteria for water quality including information on factors necessary to restore and maintain the chemical, physical, and biological integrity of surface waters. EPA has used this authority to begin work on the development of sediment quality criteria for a limited number of specific chemical substances. Possible applications of these criteria are expected to include NPDES discharge limits, waste site remediation projects, and product safety determinations.

S. 1114 would establish a new focus on sediment quality in the water quality standards section of the Act. It would require EPA to develop a plan for publishing no fewer than 8 sediment quality criteria (including PCBs and dioxin). EPA would decide which substances needed criteria developed on the basis of greatest benefit to human health or the environment.

S. 1114's focus on enhancement of sediment quality through the Clean Water Act's water quality standard program is premature. Sediment contamination is largely a "hot spot" occurrence only affecting certain limited geographical areas due to past spills or discharge practices. Existing methods of assessing exposure and ecosystem effects are adequate to assess any needed remediation goals. Because sediment contamination is only a hotspot problem, not a national problem, federal sediment quality criteria are not needed.

Further, present methods being developed by EPA for deriving sediment quality criteria have too much uncertainty associated with them to be incorporated into State water quality standards, wastewater discharge permits, or waste site remediation standards. Until methods for developing sediment criteria can be proven through peer-reviewed field validation studies, their use should be limited to screening and

setting priorities about where additional investigatory efforts are needed.

While EPA has begun work on developing sediment quality criteria methodologies for selected non-ionic organic compounds, work on developing methodologies for other types of compounds is still in the infancy stage. These methodologies must be developed and proven before EPA can satisfy a requirement to develop sediment quality criteria for many compounds, including PCBs and dioxin. This will take much longer than 4 years.

In summary, the provision in S. 1114 requiring EPA to develop a minimum of 8 sediment quality in 4 years is premature and unrealistic given the localized nature of sediment contamination and the scientific limitations in the present methodologies for assessing sediment contamination.

C. S. 1114 Would Impose Costly New Data Requirements Pursuant to FIFRA And TSCA

The current Clean Water Act directs EPA to develop water quality criteria as necessary to restore and maintain the chemical, physical, and biological integrity of water and to protect and provide for propagation of fish and wildlife and allow for recreational activities in water. Consequently, EPA has broad authority to develop water quality criteria for a wide range of substances.

Under S. 1114, a manufacturer of a pesticide would be required to provide information sufficient to develop a criterion for that pesticide as part of the FIFRA registration process. Similarly, a manufacturer of a chemical substance that is subject to premanufacture notice pursuant to Section 5 of TSCA would be required to provide information sufficient to develop a criterion, unless the substance fall into one of two limited exclusions.

These additional data requirements are inappropriate for several reasons. Currently, thousands of new pesticides and chemical

substances are subject to FIFRA registration or TSCA premanufacture notice each year. Many of these chemicals will cause no impact on water, because of the nature of the compound, e.g., they hydrolyze in water, are insoluble in water, etc., or because their use will not result in discharges to water. The exclusions provided in this bill inadequately address these situations. Further when new substances are developed, it may not be known whether they fall into one of these exclusions. Requiring manufacturers of all new pesticides and chemical substances -- except those substances meeting these limited exceptions -- to provide information to develop water quality criteria will impose a significant burden without any environmental benefit.

Current methods for development of criteria for protection of human health and aquatic life require considerable data. This is both necessary and appropriate to ensure that the criteria and resulting water quality based permit limits are based on sound science. Requiring manufacturers to conduct these costly studies as part of the FIFRA registration process or TSCA premanufacture notice regardless of whether these substances have the potential to result in water quality impacts is unjustified.

The additional data requirements will add further cost and delay to the FIFRA registration process and TSCA premanufacture notice process. Data requirements under the current TSCA premanufacture notice process, for example, are intentionally streamlined to prevent unnecessary delays in developing new chemicals.

Requiring manufacturers to develop these data for new pesticides and for new chemical substances will impose significant new costs. It will result in the generation of information for thousands of new chemicals, regardless of whether water quality criteria are needed for those substances. In addition, it is highly unlikely that EPA and the States will be able to incorporate this significant increase in information in their already resource-constrained water quality programs. As a result, manufacturers will be required to spend

millions of dollars to generate information that is not needed or ever used.

IV. Toxic Pollutant Phase-Out (Section 203)A. The Discharge Prohibition Provision In S. 1114 Will Result In Bans On Uses Of Beneficial Substances Absent Any Demonstration Of Unreasonable Risk

CMA believes that controls on pollutants that have an adverse effect on human health or the environment are warranted. However, discharge prohibitions are environment management controls that should be applied judiciously because their impact is so extreme -- they typically result in bans on the use of the targeted substance, witness DDT and PCBs.

Under Section 307(a) of the Clean Water Act, EPA already has authority to prohibit the discharges of toxic pollutants. To assert this regulatory authority, EPA must take into account a pollutant's toxicity, persistence, degradability, presence of affected organisms, effect of toxics on the organisms and the extent to which effective control is already being achieved through other regulatory authority. EPA has exercised this authority with respect to six pollutants: DDT, PCBs, aldrin/dieldrin, endrin, toxaphene and benzidine.

Section 203 of S. 1114 would replace this authority with a mandate for EPA to list "highly toxic or toxic and highly bioaccumulative pollutants" and then to ban the discharge of these listed pollutants by regulation. This provision is misguided for several reasons.

First, it applies a simplistic listing process to the determination of which pollutants must be subject to discharge prohibitions. This listing process includes no discernible criteria by which EPA identifies which pollutants are "highly toxic" or "toxic and highly bioaccumulative." This is wholly inappropriate given the extreme impacts of discharge prohibitions described above. While Congress should not legislate arbitrary standards for identifying these pollutants, a description of appropriate factors to take into account or demonstrations that EPA must make in any identifications would be

appropriate. For example, the provision fails to require any demonstration by EPA of a relationship between the discharge of the identified pollutant and unreasonable risk to human health/environment. It erroneously assumes that a discharged substance identified as highly toxic or toxic and highly bioaccumulative poses an unreasonable risk. Merely because a pollutant is toxic and bioaccumulative does not mean its discharge in any amount poses a threat to human health and the environment. EPA's determination to list a substance for discharge prohibitions must be based on a determination of adverse effect to human health or the environment from the discharge of the substance.

This provision replaces EPA's current authority to prohibit discharges with a mandate to prohibit discharges of listed pollutants. Although the bill includes limited exemptions from the prohibitions or extensions to compliance periods, these provisions are insufficient because the listing process is flawed from the outset. It fails to require EPA to consider either the societal or economic impacts of a decision to list a substance for discharge prohibition. For example, there's no requirement that EPA consider the benefits of the identified substance, the impact of its prohibition on product quality, or the availability of effective and safe substitutes.

Given the potentially extreme impacts of discharge prohibitions, another significant concern is that there is no provision for scientific peer review of either EPA's methodology for identifying pollutants for phase-out or of the listed pollutants themselves. Public review and comment on EPA's methodology for listing and any lists should also be required.

Citizen petitions for listing pollutants for prohibitions are inappropriate, particularly in the absence of any criteria by which pollutants would be identified for prohibition. The expedited listing process is also misguided because it would allow for snap decisions that could later prove incorrect. The Clean Water Act's antibacksliding provision could prevent correction of these errors. Devastating

consequences could result in affected industries, similar to those felt by apple growers as a result of the media scare about Alar in 1989. Discharge prohibition decisions must be deliberate and well considered. Citizen petitions and expedited listing processes associated with these will not promote rational decision-making.

Finally, Congress should consider the appropriateness of risk management options other than discharge bans for controlling pollutants, similar to the approach that is authorized under Section 6 of TSCA. There, when EPA determines that a substance presents or will present an unreasonable risk of injury to health or the environment, EPA is authorized to take a variety of actions, including prohibitions. The appropriate risk management action is determined only after EPA makes a balanced evaluation of the health and environmental effects and magnitude of human/environmental exposure to a chemical, the benefits of the chemical for various uses, the availability of substitutes for such uses, and the reasonable ascertainable economic consequences of the Agency's action.

In sum, this provision's mandate for EPA to list and prohibit discharges of listed pollutants is ill considered. Current EPA authority is adequate. This provision should be struck from S. 1114.

B. Review Of Priority Pollutant List Is Not Needed (Section 203(b))

Another unnecessary amendment in this bill is the requirement that EPA review and revise the priority pollutant list every five years. This requirement imposes an additional resource drain on EPA for little if any environmental benefit. EPA testified on July 1 that this authority was not needed, because EPA had no difficulty regulating pollutants that were not on the priority pollutant list. Mandating an evergreen listing process would simply take EPA's limited resources away from water quality problems of more significant concern.

V. Pretreatment Program (Section 204)A. The Proposed Changes To The Domestic Sewage Exclusion (Sec. 204(c)) Will Effect Major Disruptions In Industry At Huge Costs For Minimal Environmental Protection

The changes to the domestic sewage exclusion of RCRA, outlined in Section 204(c) of this bill, would severely limit the scope of the DSE. The impact of this limitation would be devastating -- requiring industry to spend hundreds of millions of dollars to segregate wastewaters for offsite treatment or to install redundant treatment. There is no environmental benefit to be gained by requiring these changes. There is no substantiated justification for this amendment. It is contrary to EPA's own conclusion in its 1986 Domestic Sewage Study that the DSE needed no change and that the Clean Water Act, not RCRA, provides the best means to control hazardous waste discharges to POTWs. Since that study was done, EPA promulgated new general pretreatment requirements (July, 1990) that specifically address discharges of hazardous wastes to POTWs. This amendment is unnecessary and should be struck from S. 1114.

Proponents of this amendment claim that the domestic sewage exclusion of RCRA is a loophole through which tons of hazardous waste are discharged by POTWs into waters of the United States untreated. This claim is false. It wholly disregards several factors: (1) that POTWs can and do provide adequate treatment of industrial wastewaters; 2) that industrial users of POTWs must meet both general pretreatment requirements and categorical pretreatment standards before discharging to POTWs; 3) that POTWs can and do apply local limits to wastes discharged to POTWs where needed; and (4) that POTWs treat wastes using the same treatment technology that industrial wastewater treatment plants use, to meet their own permit limits before discharging to waters of the United States. This series of controls provide more than adequate treatment of wastes discharged by POTWs.

Merely because these are Clean Water Act controls does not mean that they are less stringent than RCRA controls. In fact, many

RCRA BDAT standards were developed based on Clean Water Act standards. Any perceived differences in stringencies are merely a function of the different categorization of wastes under the Clean Water Act and RCRA. The Clean Water Act's technology-based standards represent what the best technology can achieve when applied to aggregated waste streams, which may include both hazardous and nonhazardous streams. RCRA's technology-based standards, on the other hand, represent what the best technology can achieve when applied to separate, discrete as-generated hazardous wastestreams. RCRA's BDAT standards were never intended to apply to industrial wastestreams that are discharged to POTWs and which generally consist of a wide-ranging mixture of hazardous and non-hazardous waste. They were designed to force treatment of segregated wastes that were to be disposed of on land. The change proposed to the DSE would mean that unless one of three conditions is met, industry would have to segregate hazardous wastestreams from non-hazardous wastestreams and send the hazardous wastestreams for offsite treatment and disposal or apply redundant treatment measures to these wastestreams. This is contrary to the development of CWA centralized treatment schemes like the POTWs which have proved both efficient at removal of pollutants and cost effective.

Other claims that are propelling this amendment to the domestic sewage exclusion are similarly unsubstantiated. Claims that this change will stop transfers of hazardous waste to POTW sludge are not based in fact. Even if they were, Clean Water Act sludge standards are a more direct way to address any alleged problems that may be present in POTW sludge. Similarly, claims that hazardous waste is "leaking" out of sewage pipes even before the wastes reach the POTWs are unsubstantiated. In fact, in-filtration into sewage pipes is considered a greater problem than ex-filtration. Even if ex-filtration were a serious threat, fixing the pipes would seem to be a more direct and effective solution to the problem. Rather than threatening to disrupt centralized treatment efficiencies under the Clean Water Act through this amendment, Congress should first substantiate any real problems this amendment is supposed to address, and then ask whether

these problems could be addressed more effectively and directly through other means.

Beyond CMA's basic disagreement with the need for these changes to the domestic sewage exclusion, CMA also finds the amendment language extremely confusing. Because the Clean Water Act regulates the discharge of "pollutants", while RCRA regulates "solid wastes," concepts from one statute cannot be readily transferred to another. S. 1114's effort to do so results in a provision that is so confusing it cannot readily be interpreted and applied. For example, a major source of confusion centers around a fundamental question: which of the many "pollutants" in a "solid waste" must be subject to pretreatment standard or local limit in order for the waste to be excluded from the RCRA definition of "solid waste"? Other critical terms in the bill are left undefined, such as what it means to be "in compliance" with a pretreatment standard, and what "source" must be subject to a standard.

Several large gaps also exist in this amendment that should raise some red flags. Specifically, because there is no small-quantity generator cutoff in the amendment, the amendment apparently prohibits the discharge to POTWs of household hazardous wastes unless they are subject to pretreatment standards. Also, there is no provision in the bill for wastes that are newly identified as hazardous under RCRA and for which there are no BDAT or pretreatment standards.

Another concern raised by this amendment relates to the EPA and POTW resources that would be needed to ensure that industry will be able to meet one of the three conditions established in the amendment. This resource problem relates to the fundamental question about which pollutants in solid waste would require a pretreatment standard/local limit under this amendment. While EPA may establish a schedule for promulgating pretreatment standards, it cannot identify which pollutants will be subject to a standard because that decision is made only after EPA studies an industry and determines which pollutants need to be regulated. If EPA is required to establish a standard for every pollutant that may be contained in any hazardous waste that may be

discharged to a POTW, then the process of establishing pretreatment standards will be more protracted and fewer, not more, standards will be set in the near term. The same result would occur with respect to local limits. Further, requiring local limits to be "equivalent" to BDAT raises more than just a resource problem for POTWs but also the question of ability to craft "equivalent" standards.

In sum, this amendment has not been clearly thought out. Neither the problems it aims to solve nor the manner in which it would solve them are at all clear. Congress should defer to EPA's expertise in this matter -- as outlined in the 1986 Domestic Sewage Study -- and keep the domestic sewage exclusion intact.

B. Removal Credits Should Be Granted For Other Mechanisms Besides Biodegradation (Section 204(b))

Section 204(b) of S. 1114 would restrict the availability of removal credits under the pretreatment program. Removal credits would only be allowed for toxic pollutants discharged to POTWs if the treatment by the POTW results in biodegradation of the toxic pollutant.

Biodegradation should not be the only removal mechanism allowed. Provided that the intended uses of POTW sludge are not impacted, mechanisms such as precipitation and adsorption should be considered as well. This amendment, therefore, should be struck from the bill.

VI. Pollution Prevention Planning (Section 205)A. Although Planning Is The Preferred Approach To Pollution Prevention, This Provision Is Deficient

CMA believes that voluntary planning for pollution prevention is the best way to achieve pollution prevention because it is inherently more flexible than any command and control approaches to pollution prevention. From this perspective, therefore, CMA believes that the effluent guideline and toxic discharge prohibition provisions of S. 1114 described above are misguided attempts to inject pollution prevention into the existing Clean Water Act structure.

CMA's endorsement of flexible, voluntary pollution prevention planning is grounded in the fact that voluntary plans can appropriately address the pollution prevention priorities of the facility, as opposed to the priorities established by EPA. Facility-based pollution prevention plans allow priority setting not only with respect to the particular pollutants at a facility but also with respect to the particular environmental exposure of most significance at a facility. This is why multi-media pollution prevention planning is preferable to single media pollution prevention planning. Facilities can set priorities among all their environmental releases to allow focus where the most significant risks lie and where the most significant reductions can be obtained.

CMA believes that voluntary pollution prevention planning which is multi-media and risk-based represents a superior approach for accomplishing S. 1114's objectives of promoting pollution prevention. Other pollution prevention provisions in S. 1114, including revisions to effluent guidelines in Section 201 and prohibitions on toxic discharges in Section 203, are not only misguided, they are unnecessary, if facility-based pollution prevention planning is implemented.

The proposed pollution prevention planning provision in S. 1114 approach is deficient in several ways. First, its single media focus

will skew facilities' prioritization of pollution prevention projects to the water media when this may not be where a facility can obtain the most risk reduction.

Second, its tie-in to NPDES permits will give EPA great leverage so that EPA's pollution prevention goals, rather than the facility's, could be incorporated into the plan.

Third, this provision's focus on use reduction, byproduct generation and in-process recycling restrict a facility's pollution prevention practices to the "tip" of the pollution prevention hierarchy. Pollution prevention should be viewed more broadly as any act or practice that reduces the amount or toxicity of toxic chemicals released into the environment or otherwise reduces the hazards to human health or the environment associated with such releases. Pollution prevention incorporates the entire hierarchy of environmental management practices including source reduction, reuse and recycling and other waste minimization techniques. In short, the goal of pollution prevention should be risk reduction, not meeting mandates to do "preferred" environmental management practices. Facilities should be encouraged to "move up" the environmental management hierarchy, but not to the point of ignoring risk reduction opportunities that can be achieved through practices other than source reduction or in-process recycling. As drafted, S. 1114 focuses on the methods of pollution prevention rather than risk reduction goals.

Use reduction goals are one of the minimal requirements of the pollution prevention plans in Section 205. These, in particular, raise serious concerns about the necessary use of certain raw materials in the manufacture of beneficial products; the impacts on product quality, the protection of intellectual property; and the ability of U.S. companies to compete in world markets. Because of these concerns, the requirement for use reduction goals should be struck from this bill.

It is essential that the Subcommittee correct the deficiencies in Section 205. CMA believes voluntary pollution prevention planning is

the appropriate approach to pollution prevention and that Congress should seek ways to encourage pollution prevention planning rather than mandating it. However, if Congress insists on mandating pollution prevention, it should take a flexible planning approach, rather than the command and control approach outlined in Sections 201 and 203 of the bill. Improvements to Section 205 to address the concerns raised above with this planning provision however, are in order.

Further, Congress should consider other incentive-based approaches to pollution prevention. For example, Congress should consider removal of some of the existing barriers to pollution prevention in the CWA, e.g., the restrictive nature of variance provisions like the innovative technology variance and fundamentally different factor variance; and the antibacksliding provision.

On its face, the innovative technology variance provision (Section 301(k)) suggests an approach that would provide an incentive for pollution prevention. However, as discussed elsewhere in these comments, its additional two years compliance time is insufficient. Developing, testing and assuring compliance from innovative production processes or control techniques requires considerably more time than 2 years. Further, requiring there be a determination that the innovative system has the potential for industrywide application limits the usefulness of this provision considerably given the facility specific nature of pollution prevention techniques.

Another provision which EPA has interpreted so rigidly that it affords little flexibility in the requirements of the CWA is the Fundamentally Different Factors (FDF) variance provision. Such a provision, if interpreted more broadly, could provide incentive for facilities to undergo pollution prevention projects by allowing them to obtain a variance from an effluent limitation. However, EPA has granted so few FDFs over the years that it is not viewed as providing any real relief from the technology-based effluent limitations. The result can be, again, to discourage rather than encourage pollution prevention.

Under the Clean Water Act, the antibacksliding provision is perhaps the most inflexible provision in the Act. While the objective of this provision is commendable -- to prevent backsliding from limits that had been achieved and to maintain existing water quality -- arguably this provision can discourage pollution prevention. For example, for a facility to achieve a significant reduction in the amount of one pollutant that it discharges, it may be desirable to substitute a different material in the manufacturing process. Use of this material, however, may result in an insignificant increase in the level of another pollutant in the facility's wastewater. If this slight increase will cause the facility to exceed its discharge limit for that pollutant, then the substitution cannot and will not be made, despite the environmental benefits that would result from the significant reduction in the pollutant for the discharge. The provision that prevents a facility from obtaining a less stringent permit limit is the antibacksliding provision at Section 402(o) of the Act.

As Congress looks for ways to promote pollution prevention in the Clean Water Act, it should address these inherent inflexibilities in the Act that stand in the way of real progress in further reductions of wastes and releases.

VII. Permit Fees (Section 501)A. S. 1114 Would Grant EPA Broad Authority To Collect Fees From Industry To Pay For Agency Activities Not Directly Related To Industrial Discharges

The current Clean Water Act does not require states to collect permit fees from NPDES permit applicants. However, a number of states currently have permit fee programs. The amount of fees collected and the scope of activities for which costs are defrayed by permit fees vary from state to state.

S. 1114 would add a new provision to Section 402 of the CWA that would require States to develop a program to collect fees from NPDES permit holders and industrial users of POTWs. The amount of fees that a State collects must be sufficient to cover not less than 60 percent of the costs of developing and administering point source elements of the State's water quality program as well as the sewage sludge disposal and pretreatment program. EPA would be authorized to establish a Federal permit fee program for states that do not have permitting authority or that do not have EPA-approved permit fee programs.

Permit fees are an appropriate source of revenue for the administration of the Clean Water Act's NPDES permit program. However, targeting permit fees for purposes other than the cost of processing permit applications is unacceptable. To do so is to ask permittees to pay for more than their fair share of the water program.

Under S. 1114, fees from industrial dischargers would be used to cover a very broad range of Agency activities, many of which are not directly related to permitting of industrial discharges or their impacts. Examples of programs that would be funded through this fee on industrial dischargers, but which affect and benefit more than permitted industrial dischargers, include: 1) ambient water quality monitoring; 2) setting of water quality standards; 3) modeling, planning, analyses and demonstrations; 4) preparing and maintaining public information systems; and 5) evaluating the performance of

laboratories. Fees should be provided from general funds for these types of activities because they are not directly related to industrial discharge permitting activities.

Industry has already invested large sums of money to comply with existing regulations and standards. This provision's wording "no less than 60 percent of the cost" allows government to extract most of its funding from industry.

Industry should not pay for development of water quality standards because these standards are based on water bodies and watersheds and not on discharges. Further, these standards will affect more than industrial dischargers under the proposed watershed planning and non-point source requirements of S. 1114.

Any proposed permit fee programs should provide for an audit of use of the funds collected. As drafted, there is no accountability mechanism. There is also no cap on the fee collected from a discharger.

VII. Permit Program Modifications (Section 502)

A. Proposed Permit Program Modifications In S. 1114 Would Discourage Industry From Developing Innovative Processes And Technologies

Section 301(k) of the Clean Water Act authorizes EPA to extend the compliance date for facilities subject to an effluent guideline for up to 2 years if the facility proposes to meet effluent standards-- or achieve significantly greater effluent reduction than is required -- using an innovative production process or an innovative control technology.

S. 1114 would limit the usefulness of the innovative technology variance by allowing additional compliance time to cover only the development and testing of innovative technologies. Section 502(h) would reduce the additional time period for compliance under the Section 301(k) variance from 2 years to 90 days.

The current Clean Water Act's innovative process and control technology variance was intended to provide an incentive to facilities to develop innovative, cost-effective compliance approaches involving process changes or new types of treatment technology. S. 1114 would create a disincentive to innovation since the time period needed to develop, test and comply with innovative process and control technology is significant, particularly when compared to the time period needed to comply with demonstrated treatment technologies. An additional 90 days is wholly inadequate. Reducing the additional time period for compliance from 2 years to 90 days eliminates the usefulness of this variance and will discourage facilities from developing innovative processes or technologies.

Instead of creating disincentives, Congress should look for ways to create incentives to encourage development of innovative compliance approaches. For example, even the current 2 year compliance extension is an insufficient incentive to seek and develop innovative techniques. A five year compliance extension is a more appropriate incentive. Adding compliance extensions or waivers from CWA

limitations for innovative technologies that achieve a net environmental benefit to all media would both encourage innovation while simultaneously promoting pollution prevention.

VIII. Enforcement (Section 503)A. The Clean Water Act Already Includes Ample Enforcement Authority, And Amendments To The Statute Are Neither Necessary Nor Appropriate

According to a recent EPA report, there was more enforcement under the Clean Water Act than under any other environmental statute during fiscal year 1992, and penalties assessed during that year reached record highs. The EPA report dramatically illustrates that effective enforcement of the Act's requirements is taking place, and that no additional enforcement authority is needed. In particular, the report states that:

- 29% of all the civil and administrative penalties EPA collected during fiscal year 1992 resulted from Clean Water Act enforcement;
- there were also more criminal fines assessed under the Clean Water Act - \$39.7 million - than under any other environmental statute; and
- the average judicial penalty under the Clean Water Act rose to a record high of \$456,871.

See Enforcement Accomplishments Report FY 1992 (EPA 230-R-93-001).

This record-breaking enforcement of the Clean Water Act occurred in a year in which EPA's enforcement of all environmental statutes under its jurisdiction also reached record highs. Indeed, in fiscal year 1992 alone, EPA assessed approximately 28% of all of the civil and criminal penalties combined that EPA had assessed in its entire history. These figures, which of course do not reflect any enforcement by states, belie any claim that EPA's enforcement of the Clean Water Act is inadequate, or that the Agency lacks adequate enforcement tools.

Yet, S. 1114 inexplicably proposes significant -- and we believe counter-productive -- amendments to the Clean Water Act's enforcement provisions. Put simply, there is no need for additional enforcement

tools, or for modifications to the Act's enforcement provisions. CMA's specific concerns with the proposals in S. 1114 are discussed below.

B. There Is No Need To Expand Citizen Suit Enforcement

The U.S. Supreme Court held in the landmark Gwaltney decision that citizens could not bring actions under the Clean Water Act based wholly upon past violations which had ceased and which were not likely to recur in the future. S. 1114 would reverse this decision, allowing citizens to bring suits for such past violations even though the environment will not benefit at all. For the reasons discussed below, reversing the Gwaltney decision is both unwarranted and is bad public policy.

First, if the objective of citizen groups is to improve compliance with NPDES permit requirements, rather than simply to fill their own coffers with the award of substantial attorneys fees, then such groups should pursue dischargers who are currently violating the Act; they should not spend time and effort chasing dischargers who have cured any problems that may have existed. After all, the interests of citizens are not impaired when a discharger is in compliance with its permit.

Second, whether a discharger who has come into compliance with its permit should be assessed punitive penalties for wholly past violations is an issue that should be left solely to the discretion of governmental enforcement authorities. Vesting such discretion in governmental authorities, who are publicly accountable, provides some assurance that lawsuits for past violations will only be brought when they involve significant exceedances. Such discretion, which of course is not unique to the area of environmental enforcement, is also essential to ensure that limited resources are not spent addressing alleged violations that are of little or no environmental significance. Similar restraint is not required of citizen plaintiffs, however, who can recover their attorneys' fees and costs in enforcement litigation regardless of the seriousness or significance of the violations at issue. Accordingly, there is no incentive for citizens

to pursue "bad actors," as opposed to "deep pockets," and no safeguards to ensure that citizens suits address truly significant environmental issues that deserve enforcement and judicial attention. Limiting citizen suits to ongoing violations provides at least some assurance that the citizen suit enforcement authority will actually be used to the benefit of the environment, and not abused for the benefit of the citizen groups' lawyers.

Enforcement discretion is also important because of the way in which permit limits are derived. In promulgating technology-based effluent limitations guidelines and in developing permit limits in the absence of guidelines, EPA uses a statistical approach that virtually ensures that some exceedances of permit limits will occur. In particular, EPA establishes daily maximum and monthly average discharge limits based upon concentration levels that, on a statistical basis, the best available technology can achieve 99 and 95 percent of the time, respectively. This methodology thus virtually ensures that dischargers will violate their daily maximum limits 1 percent of the time and their monthly average limits 5 percent of the time. In light of this, it is almost surprising that the record of compliance with Clean Water Act requirements is so high. As Senator Graham stated during a July 1993 hearing on the Act's reauthorization, 87 percent of dischargers are in significant compliance with their permits.

Another reason why enforcement discretion is needed is the nature of the analytical tools that facilities must use to measure compliance with permit limits in the parts-per-billion range. Even state-of-the-art analytical techniques are not capable of precisely measuring pollutant concentrations at these low levels. As a result, there is a range of error associated with each analytical measurement, and some reported "exceedances" of permit limits that are within the range of accuracy of the analytical methods may not be exceedances at all.

What this means is that not all violations of the Act warrant enforcement. This is particularly true with respect to past violations

that are no longer recurring. Prosecutorial discretion, which can only be exercised by governmental enforcement authorities, is therefore essential to ensure that dollars and judicial resources are not wasted needlessly on insignificant problems.

S. 1114 would also amend the Act to allow citizen suits even when a state has exacted an administrative penalty for precisely the same violations. There is simply no justification for this proposal. Under the existing Act, state administrative proceedings only bar citizen suits if the proceedings are conducted under a state law that is comparable to the Clean Water Act. The Act requires public notice of any administrative penalty assessment. Thus, citizen groups have ample opportunity to participate in state administrative proceedings; a group that fails to exercise this right should not be allowed to sit on the sidelines during the state proceedings and then bring a duplicative enforcement action later simply because it is dissatisfied with the penalty that the state imposed.

C. Natural Resource Restoration Should Not Be Part Of Clean Water Act Enforcement

S. 1114 will allow the courts to order dischargers to take whatever action may be necessary, including the restoration of the natural resources damaged or destroyed as a result of the discharger's violation. Such a broad expansion of the Act's enforcement authority is wholly unnecessary and will result in costly, protracted litigation. CMA therefore urges Congress not to adopt this provision, for two reasons.

First, existing law already provides adequate mechanisms to address releases of hazardous substances. For example, Superfund authorizes EPA either to order the remediation of a release or to perform the remediation itself and recover its costs from responsible parties. Superfund also provides for the recovery of natural resource damages caused by such releases. In addition, Section 311 of the Clean Water Act is particularly designed to address spill remediation.

Second, the restoration of natural resources is not a simple or straightforward process; quite to the contrary, it is still very much in the developmental stages with no clear track record as to what is feasible and what is not, what works and what does not. In addition, there has been extensive litigation concerning natural resource damages under Superfund, in spite of the fact that the statute contains detailed provisions concerning the collection of such damages. By contrast, S. 1114 provides no guidance for either the courts or the regulated community as to what is meant by natural resource damage restoration. As a result, it will undoubtedly result in more and more lengthy litigation, for an uncertain environmental benefit. This in turn will consume large amounts of the limited resources of governmental authorities, the judiciary and industry. Accordingly, natural resource restoration should not be added to the Clean Water Act. Where a real problem exists, it can be addressed under Superfund.

D. Dischargers Should Not Face Multiple Penalties As A Result Of A Single Operational Upset

NPDES permits typically contain limits on a dozen or more individual pollutants. Indeed, chemical industry permits may have limits on as many as 60 individual pollutants. As a result, if a treatment plant malfunctions or if there is an upset in the process, a discharger may simultaneously violate several pollutant limits.

In 1987, Congress realized that it was unfair to impose multiple penalties on a discharger if an operational upset resulted in the violation of more than one pollutant limit. Congress therefore provided that, for purposes of administrative, civil and criminal penalties, a single operational upset that leads to simultaneous violations of more than one pollutant parameter shall be treated as a single violation.

Now, inexplicably, Congress has proposed to remove the "single operational upset" provision from the Act. We are aware of no data assembled during the past six years that would support such a reversal in policy.

Penalties under the Act are already high -- up to \$25,000 per day per violation for civil penalties. If Congress repeals the "single operational upset" provision, then a facility that has an upset and, as a result, violates 20 pollutant limits for two days until it can remedy the problem, will face a penalty of \$1 million. This is wholly out of proportion to the nature and duration of the offense.

Congress should therefore adhere to the policy it adopted in 1987 and retain the "single operational upset" provision for administrative, civil and criminal penalties.

E. Contract Bars Should Not Apply To Dischargers Found Liable For Civil Penalties, Or To Other Than The Offending Facility

The existing Clean Water Act prohibits federal agencies from entering into contracts with any person convicted of a criminal offense under the Act if the contract is to be performed at any facility which gave rise to the conviction if the facility is owned by such person. S. 1114 would greatly expand this contract bar to cover any facility owned by a person found guilty of a criminal offense, and to cover persons found liable only for civil penalties. Again, the perceived need for this radical expansion of the contract bar amendment is a complete mystery. Moreover, the proposed amendment is so broad that it unfairly penalizes facilities that have not done anything wrong and persons who did not willfully violate the Act.

For example, if an employee at one of many facilities owned by a company violates company policy and submits a false report to EPA, and the company pleads guilty to a criminal offense, then none of the other facilities owned, leased, operated or supervised by that company may receive any government contract work, even though the other facilities had absolutely nothing to do with the offense. Similarly, under the existing Act a discharger is liable for civil penalties for any violation of its permit, regardless of whether the violation is the result of the facility's negligence. And, as discussed earlier, such exceedances of permit limits will occur because of the way in which EPA and the states derive permit limits. Barring a facility that

experiences such as exceedances, and pays civil penalties, from government contracts is wholly unjustified; payment of the civil penalty alone is more than adequate punishment.

Disqualification from government contracts is an extraordinary sanction; for some it would spell financial ruin. The existing Act already provides for disqualification in appropriate circumstances; to expand the scope of the contract bar to facilities that are not "bad actors" is grossly unfair.

F. Administrative Penalties Provide An Adequate Tool To Address Minor Exceedances; There Is No Need For Field Citation Authority

In 1987, Congress authorized EPA to impose administrative penalties. The administrative penalty authority was intended to provide EPA a quick, easy way to address relatively minor violations of the Act that previously could be prosecuted only in the courts. EPA's recent enforcement report indicates that EPA is making frequent use of its administrative penalty authority. In particular, during fiscal year 1992, administrative penalty cases increased by 56 percent over the 1991 level, and administrative penalties accounted for 22 percent of the total non-criminal penalties EPA collected under the Act. The EPA report also states that "[t]he Office of Enforcement expects that the trend toward greater use of [Administrative Penalty Order] authorities will continue" Notwithstanding the success of the administrative penalty programs, Congress now seeks to add an additional enforcement tool -- field citations. CMA urges Congress not to pile on additional enforcement mechanisms.

As discussed earlier, because of the way in which permit limits are derived, and because of the inability of state-of-the-art analytical tools to measure pollutant concentrations accurately at low levels, minor exceedances of permit limits will occur. It is not appropriate to impose penalties for all of these minor violations. Yet, the authority to issue field citations will encourage precisely this, and will significantly reduce the advantages that careful exercise of enforcement authority brings to enforcement of the Act.

CMA also has concerns about the particular language of the field citation provision. First, S. 1114 provides that field citations may not exceed \$5,000 per day for "each" violation, and may not exceed a total of \$25,000 for "the" violation. Since each daily exceedance is a separate violation, the applicability of the \$25,000 cap for "the" violation is unclear. If notwithstanding our views Congress adopts field citations, then no citation should exceed \$25,000 in total, regardless of how many individual violations are covered. If there are multiple violations and the \$25,000 cap is too low, then use of a field citation is inappropriate.

Also, S. 1114 provides that payment of a field citation is not a defense to further enforcement by EPA or a State. This is unconscionable. A discharger that pays a penalty for a violation should not be subject to further enforcement by EPA, a state, or a citizen group. It is not enough that the amount of any field citation may be taken into account in assessing penalties in a subsequent enforcement action, as S. 1114 proposes.

G. There Is No Need To Modify The Amounts That EPA May Collect As Administrative Penalties

S. 1114 would authorize Tier I administrative penalties up to \$10,000 per day for each violation; the existing statute authorizes a Tier I penalty of up to \$10,000 for each violation. While S. 1114 characterizes this change as a "technical amendment," it plainly is not. Because there is very little in the way of procedural protections for a discharger faced with a proposed Tier I penalty, it is unfair for such penalties to be excessive in amount. The increased penalty proposed by S. 1114 is simply inappropriate in these circumstances.

S. 1114 would also increase the cap on Tier II administrative penalties from \$125,000 to \$200,000. While there are more procedural protections associated with a Tier II penalty, the purpose of administrative penalties was to provide a quick, easy way to address relatively minor violations. Penalties up to \$200,000 are not minor.

At that level, dischargers may be inclined to take advantage of the various opportunities to challenge the penalties, frustrating the very rationale for such penalties. Accordingly, Congress should not increase the cap on Tier II administrative penalties.

H. Congress Should Not Dictate Administrative Penalty Levels For The States

S. 1114 would require states to demonstrate the authority to recover an administrative penalty in a maximum amount of not less than \$10,000 per day in order for the state to demonstrate adequate authority to enforce the Act. Unlike federal administrative penalties, which are currently capped at \$25,000 and \$125,000 for Tier I and Tier II penalties, respectively, S. 1114 does not include an overall cap on the state administrative penalty authority. What this means is that states must demonstrate that they have more administrative penalty authority than Congress has seen fit to give to EPA. This will be true even if Congress increases the Tier II cap from \$125,000 to \$200,000 since the caps in the Clean Water Act are not maximum daily caps, but total caps.

Congress should not dictate to the states any particular level of enforcement authority. If EPA believes that a state is not adequately enforcing the Act, EPA is always free to bring its own enforcement action. Alternatively, EPA may withdraw approval of a state program if the state's enforcement is inadequate. Prescribing penalty levels, particularly levels that are higher even than EPA is authorized to impose, is an egregious intrusion in state enforcement prerogatives. This provision should therefore be deleted from S. 1114.

20 October 1993

The Honorable Max S. Baucus
Chairman
Senate Environment and Public Works Committee
706 Senate Hart Office Building
Washington, D.C. 20510-2602

Dear Senator Baucus:

Enclosed please find testimony on and suggested additions to S. 1114, the Water Pollution Prevention and Control Act of 1993, an excerpt from EPA's *Managing Nonpoint Source Pollution*, and an excerpt from our January 1993 newsletter. Please enter them in the official record, and consider them as you discuss clean water legislation.

Sincerely,

Charles A. Cannon
Executive Vice President

COMPOSTING AS A WATER POLLUTION CONTROL STRATEGY

THE COMPOSTING COUNCIL, 114 S. PITT ST., ALEXANDRIA, VA 22314 703 739 2401
20 October 1993

The Benefits of Composting

Composting is a way to make organic matter -- like agricultural wastes, sewage sludge, yard trimmings, and food scraps -- biodegrade under controlled conditions. The result is compost, which conditions and improves soil. Compost improves soil's ability to retain water, helps plants fight disease, and slowly releases nutrients to the soil. Plants grown in soil with compost are generally more robust and numerous. Compost is good for controlling erosion, repairing salt-damaged roadsides, reclaiming mineland and other disturbed land, and rebuilding wetlands. It's useful in nurseries, cropland, tree farms, parks, and in all kinds of landscaping.

Composting is Recycling

Composting is a way to recycle a large part of the waste stream not available to conventional recovery. It recycles agricultural waste, sewage sludge, yard trimmings, and food scraps into useful products valuable to agriculture, horticulture, and landscaping. Only when organic and conventional recycling are used in tandem can aggressive recycling targets be met. The US EPA considers composting to be a form of recycling, and includes it in its recycling numbers when reporting on the waste stream.

Its Role in Water Pollution Control

Composting has strengths well-suited to water pollution control efforts, in particular to nonpoint source pollution control. The US EPA and the state of Oregon explain some of them in the accompanying documents. In sum, composting has the following benefits to water pollution control:

- Composting ties up nitrogen and other excess nutrients that would otherwise go into runoff
- Compost is often used as a "biofilter" - air or water are passed through it, as it locks up heavy metals and other pollutants and lessens odors
- Compost retains water very well, which controls erosion and runoff, and reduces watering needs
- Using compost reduces the need for chemical fertilizers in the first place

We encourage Congress to realize in S. 1114 two important goals at once - to promote recycling and to curb water pollution - through the use of composting and compost use.

SUGGESTED AMENDMENTS TO S. 1114

THE COMPOSTING COUNCIL, 114 S. PITT ST., ALEXANDRIA, VA 22314 703 739 2401

20 October 1993

Proposed deletions are in ~~strike~~through, proposed additions are underlined.

Section 2 (a) (5) [page 4]

Substantial opportunities exist to improve water pollution control by using new water pollution control strategies, such as pollution prevention planning, water conservation, composting and compost use, the development of innovative pollution control technology, comprehensive watershed planning, and programs that protect the physical and biological properties of aquatic systems.

Section 2 (a) (7) [page 4]

Substantial opportunities exist to improve water pollution control by addressing pollution from nonpoint sources, such as construction, forestry, and agriculture, particularly through the use of watershed planning, targeted control measures, composting and compost use, and financial assistance.

Section 304 (a) "(c)" [page 108]

(1) In general - The Administrator, in consultation with the heads of other Federal agencies, shall publish guidance that specifies elements of nonpoint pollution management programs. The guidance shall consider composting and the use of compost as elements in nonpoint pollution management programs.

Section 304 (c) "(f) (2) (A) (i)" [page 119]

(i) provide for the implementation of management measures that are appropriate to the site, economically achievable by the owner or operator of the source, and will reduce water pollution; with consideration given to composting and compost use; ...

Section 304 (c) "(f) (3)" [page 120-121]

(3) Handbook - Not later than 18 months after the date of enactment of this paragraph, and as appropriate thereafter, the Administrator, in consultation with the Secretary of Agriculture and the heads of other appropriate Federal agencies and the States, shall publish a handbook to assist the development of plans for agricultural sources pursuant to this subsection. The handbook shall give consideration to composting and compost use.

Section 304 (d) (3) "(l) (1) (A)" [page 126-127]

(A) In general - The President shall direct the heads of appropriate Federal agencies that own or manage land to implement regulations that shall take effect not later than the date of enactment of this paragraph, to ensure the implementation of appropriate measures to control nonpoint sources of water pollution, including composting and compost use, and, at a minimum ...

Section 304 (e) "(o) (1)" [page 129-130]

(1) In general - Not later than 2 years after the date of enactment of this paragraph, the Administrator, in consultation with the Secretary of Agriculture, shall publish guidelines for the design of animal waste management facilities. The guidelines shall include appropriate composting facility specifications, as well as ...

Section 403 "Section 113 (b) (1) (I)" [page 144]

(I) promoting water-efficient vegetative cover, ~~and landscaping~~, composting and compost use; and ...

**TESTIMONY OF
DON GRAY, WATER PROGRAM DIRECTOR,
ON REAUTHORIZATION OF THE CLEAN WATER ACT**

October 1993

**TESTIMONY OF DON GRAY, WATER PROGRAM DIRECTOR,
ON REAUTHORIZATION OF THE CLEAN WATER ACT**

I am pleased to submit this testimony on reauthorization of the Clean Water Act to the Subcommittee on Clean Water, Fisheries and Wildlife of the Senate Committee on Environment and Public Works.

The Environmental and Energy Study Institute (EESI) is a private, non-profit, non-partisan organization which seeks to promote informed Congressional debate on environmental and energy issues and to develop innovative policy responses. Earlier this year, we held a series of briefings entitled "New Policy Directions to Sustain the Nation's Water Resources," which elicited the views of a diversity of experts concerning today's most important water issues and policy options for their solution. A remarkable consensus emerged on the need for a more holistic and integrated approach to national water policy. There was also general agreement that such a national water policy should:

- (1) conform to the natural hydrologic system by taking into account the interconnections between groundwater and surface waters, the interrelationships between the nature and quantity of water use and water quality and the effects of both quantity and quality on water-dependent ecosystems;
- (2) give preference to pollution prevention as the most effective implementation strategy; and
- (3) utilize watersheds as the basic unit for developing and implementing water policy.

(A report on the briefings is attached.)

In my opinion, adherence to these three principles in the reauthorization of the Clean Water Act will improve the likelihood of achieving the goals of the act in the most cost-effective

manner. Such an approach would involve using pollution prevention and water conservation measures wherever possible on a watershed basis to address both point and "nonpoint" sources of surface and groundwater contamination and to protect and restore the ecological integrity of aquatic ecosystems. It also would allow flexibility to target the most acute problems in a given area and make maximum use of existing resources at all levels of government.

I commend the committee on the fact that S.1114 reflects these principles in many respects. However, there are two crucial areas which I believe are not addressed adequately under the existing Clean Water Act or other federal law or in S.1114. They are: (1) nonpoint source contamination of groundwater which may in turn pollute surface waters, and (2) using water conservation to achieve water quality goals.

These gaps can be dealt with by incorporating the principles and approach I have outlined into the Clean Water Act wherever possible.

REFLECTING THE DYNAMIC HYDROLOGIC INTERRELATIONSHIPS OF WATER

Groundwater

If the Clean Water Act is to meet its water quality goals, it must take cognizance of the interconnections between groundwater and surface waters. Groundwater contamination by pesticides, nutrients and other diffuse or nonpoint sources of pollution is so pervasive, and the extent of groundwater's contribution to surface water flows is so great, that contaminated groundwater can be a major pollutant of rivers, streams, lakes and wetlands.

Studies by the U.S. Geological Survey (USGS) indicate that groundwater supplies an average of 40 percent of streamflows nationwide, and that in some areas the figure may be as

high as 95 percent. By way of comparison, USGS estimates that the volume of groundwater discharged to the Chesapeake Bay is equal to that discharged by the James River.

Groundwater provides a pathway for the transport of pollutants, and, if high groundwater contaminant levels coincide with groundwater discharge points to surface waters, the result may be serious surface water pollution. Conversely, during flood periods, heavily polluted surface water may leach into and be stored in groundwater until it is discharged back to the stream, thus creating a continuing source of surface water pollution. Early data from USGS indicate that the recent flooding in the Midwest may present a graphic illustration of this problem.

There is ample evidence that surface water quality has already been degraded by contaminated groundwater in many areas. For example, a 1991 study by USGS found high levels of the herbicide atrazine in the Cedar River in Iowa, even during periods when there was little surface water runoff. The study concluded that the atrazine came from groundwater contaminated some distance from the river. Other USGS studies have found that contaminated groundwater is a persistent source of herbicide pollution in many Midwestern streams and that groundwater substantially affects the water quality of streams in the Suwannee River Basin in Florida. A non-USGS study estimated that 50 percent of the pollutant loading to the Niagara River is from groundwater sources.¹

At a recent EESI briefing, scientific experts discussed numerous examples where control measures which focus only on direct sources of surface water pollution -- and ignore groundwater -- are ineffective. Paul Jehn of the Water Resources Research Institute at the University of Idaho presented evidence that groundwater contaminated by nutrients from agriculture, animal feedlots, septic tanks and other sources not subject to National Pollutant Discharge Elimination System (NPDES) permitting requirements under the Clean Water Act, or to regulation under the Solid Waste Disposal Act (SWDA) or other federal law, has contributed significantly to eutrophication

¹ Tarlock, Dan, *Symposium on the Prevention of Groundwater Contamination in the Great Lakes Area*, Chicago, Kent Law Review, Vol. 65.

of the Snake River in Idaho. According to USGS, four-fifths of this river's flow is derived from groundwater. Jehn reported that the mats of algal blooms resulting from the eutrophication are so thick that muskrats have been spotted walking across the river on them, and they ensnared the governor of Idaho's boat during an inspection tour.

At the same briefing, Professor Jack Stanford, a groundwater ecologist from the University of Montana, described recent scientific discoveries that many forms of marine life move back and forth between groundwater and surface waters. These discoveries led him to conclude that the existing widespread contamination of groundwater may harm or destroy unique species which provide crucial ecological connections between groundwater and surface waters. Consequently, he recommended that the Clean Water Act be amended to protect and enhance the interactions between groundwater and surface waters in order to protect and restore their biological integrity, a stated goal of the act.

Although surface and groundwater quality are clearly linked, groundwater is not accorded the same level of protection under the Clean Water Act. For example, groundwater protection is not specifically included in the act's declaration of goals and national policy and is not regulated as an indirect route of point source discharges under Section 402. Nor are the nonpoint source assessment and management requirements of Section 319 mandatory for groundwater.

It appears to me to be self-defeating to spend billions of dollars to cleanup surface water and not take adequate steps to prevent the contamination of groundwater which can repollute it. I am not advocating the adoption of a new federal regulatory program for groundwater. But there are provisions currently within the Clean Water Act which can be strengthened or expanded in order to prevent the pollution of surface waters by contaminated groundwater.

For example, if the Clean Water Act is to achieve its ultimate objective "...to restore and maintain the chemical, physical, and biological integrity of the nation's waters," I believe the national policy expressed in Section 101 (a)(7) "that programs for the control of nonpoint sources

of pollution be developed and implemented in an expeditious manner..." must be amended to make clear that it applies to groundwater as well as surface water.

There also is a need to incorporate groundwater into some of the regulatory provisions of the act. I do not think it is necessary or practical to extend the NPDES permit requirements to cover point source discharges to groundwater because most such major sources are regulated under the Resource Conservation and Recovery Act (RCRA) or the Safe Drinking Water Act (SDWA) or other federal law.

I was pleased to note that the provisions in Section 201 of S.1114 dealing with effluent guidelines, new source performance standards and pretreatment standards for point source industrial dischargers, "prohibit or limit the release of pollutants to other environmental media (including ground water) to the extent that ... is technologically and economically achievable...."

However, I think that Section 402 of the act also should be amended to require that, as a condition of receiving a new or renewed NPDES permit, a discharger must demonstrate that the facility is managing all potential pollutants in a manner that will not contaminate groundwater, or that the groundwater is not hydrologically connected to a surface water body. Such a requirement would prevent a permittee from meeting NPDES permit discharge limits by storing pollutants in unlined surface impoundments, or using other methods that could contaminate groundwater, thereby creating an unpermitted route of point source discharges to surface water.

Industrial wastewater lagoons containing hazardous wastes are subject to the groundwater monitoring, liner, land ban and other requirements of RCRA. However, lagoons not subject to these requirements, because they do not contain hazardous wastes, could still contain pollutants such as industrial non-hazardous wastes, nitrogen and phosphorous that may adversely affect water quality and marine life.

Moreover, lagoons at publicly owned treatment works containing hazardous or other wastes mixed with domestic sewage are not subject to the RCRA requirements. Yet a Congressionally mandated study by the Environmental Protection Agency (EPA)² identified 5,476 municipal wastewater lagoons nationwide, of which 433, or 8 percent, receive significant quantities of industrial wastewater. Sampling data identified 94 priority pollutants at concentrations up to 1000 parts per billion (ppb) in lagoons receiving industrial wastes and 35 priority pollutants at concentrations up to 280 ppb in those receiving only domestic wastewater. Using the sampling data and computer modeling to assess the potential impact of municipal wastewater lagoons on groundwater quality and human health, the study concluded that, while the potential for each is low, "some lagoons with industrial discharges may be potential sources of ground-water contamination [and] lagoons with significant industrial discharges pose a potential risk to human health."

The report found that state standards for lagoon design and construction and for groundwater monitoring vary widely and that some may be inadequate for protection of groundwater where lagoons receive significant industrial wastes. Consequently, it recommended that states review their standards and monitoring requirements for such lagoons located in highly vulnerable hydrogeologic settings and outlined a number of steps which could be taken to prevent their contaminating groundwater. Therefore, it does not seem unreasonable to require in the Clean Water Act that applicants for NPDES permits which have lagoons demonstrate that they have taken appropriate steps to prevent the contamination of groundwater which could in turn contaminate surface waters.

I also recommend that Section 319 be amended to extend the requirements of the nonpoint source assessment and management provisions to include groundwater that is hydrologically connected to surface water. Section 319 currently requires states to identify streams subject to nonpoint source pollution and develop programs to control the activities responsible for the

² *Report to Congress: Municipal Wastewater Lagoon Study, 1987*

pollution. But the state programs are not *required* to address nonpoint sources of groundwater contamination and are unlikely to use limited resources to do what they are not required to do.

This narrow perspective ignores the natural hydrologic system and may undermine the effectiveness of the act in preventing surface water pollution. For example, efforts to reduce surface runoff of nonpoint pollutants by retaining water in or on the ground may increase the likelihood that the pollutants will leach to groundwater and, where the groundwater and surface water are interconnected, may merely change the route they take to the surface water. The failure to require state programs to address nonpoint sources of groundwater contamination creates a serious gap in water quality protection, since nonpoint sources of groundwater contamination are not addressed adequately under other federal laws.

I am concerned that S.1114 strikes paragraph (5) of subsection (h) of Section 319, which authorizes the Administrator, in making nonpoint source program implementation grants, to give priority to states which implement certain types of activities. Among the priority activities eliminated is one to "carry out ground water quality protection activities which ... are part of a comprehensive nonpoint source pollution control program, including research, planning, ground water assessments, demonstration programs, enforcement, technical assistance, education, and training to protect ground water quality from nonpoint sources of pollution."

I believe that this may be the result of a drafting error, which I hope will be corrected. If not, it would certainly be a step in the wrong direction in view of the great harm which nonpoint source contamination of groundwater can inflict on surface waters. An approach that relies on cleaning up groundwater later, if it interferes with achievement of surface water goals, is short-sighted and likely to fail because groundwater cleanup is difficult, expensive and time-consuming.

Water Quantity

Just as groundwater is a key component of the natural hydrologic system with a clear impact on surface water quality, so the quantity of water in the system has significant impacts on water quality and water-dependent ecosystems. If water is used more efficiently, the quantity of water in lakes, streams, wetlands and aquifers is likely to be closer to natural levels. As a result, water quality can be protected more readily, and wetlands can be maintained and aquatic ecosystems preserved, especially during periods of low rainfall.

I believe that issues involving water quantity, maintenance of instream flows and water use efficiency can be addressed most effectively on a watershed basis. Therefore, I recommend that the watershed planning and management activities proposed in S.1114 and the state programs for nonpoint pollution control required by Section 319 of the act specify that these critical issues be addressed.

Other Clean Water Act provisions also should be amended to conserve water and protect aquatic ecosystems. For example, Section 303 should be amended to mandate that during the water quality standard-setting process, each state establish minimum stream flow requirements, in order to spur water efficiency initiatives and protect aquatic life.

Wetlands

Wetlands provide a vivid demonstration of the dynamics of the natural hydrologic system because they are dependent upon the quantity and quality of both ground and surface waters. Studies by USGS indicate that in many, if not most, cases, wetlands are the visible discharge of groundwater rather than the recharge area for groundwater. Consequently, wetlands protection is highly dependent upon protecting both the quantity and quality of groundwater. Similarly, construction of artificial wetlands to replace those that are lost can succeed only if the natural hydrologic system can supply the quantity and quality of water necessary to sustain them and the ecosystems they support.

EESI is a member of Water Quality 2000 and supports its recommendations for protecting wetlands, which have been transmitted to the committee. These include making wetlands protection an explicit goal of the act, expanding the scope of the Section 404 program to include more of the activities that destroy wetlands, strengthening the permitting program to address cumulative and incremental impacts, and adopting tax and other financial incentives to encourage protection of privately owned wetlands.

I was pleased to see that S.1304, the wetlands bill introduced by the Chairman and Ranking Minority Member of the committee, and which I understand will be incorporated into the reauthorization bill, is responsive to many of these recommendations. I was especially pleased to note that the definition of a wetland in the bill includes areas inundated or saturated not only by surface water, but by groundwater as well.

I think this is a very good idea, since so much of the water in wetlands comes from groundwater.

S.1304 requires that the wetlands delineation guidelines be based on the best available scientific information and take into account regional variations in hydrology, which I assume would also include groundwater as well as surface water. However, it may be advisable to specify that both groundwater and surface water hydrology be taken into account.

POLLUTION PREVENTION IS THE MOST EFFECTIVE IMPLEMENTATION STRATEGY TO ACHIEVE CLEAN WATER ACT GOALS

The Clean Water Act implicitly recognizes pollution prevention as the preferred strategy for restoring the integrity of the nation's waters by adopting as a goal the elimination of all pollutant discharges. The pollution prevention planning requirements in Section 205 of S.1114 are a positive step towards the achievement of this goal. However, they cover a minimum of only 20 pollutants, reductions in the discharge of which EPA determines "are likely to result in

a benefit to human health or the environment." Moreover, pollution prevention plans would be required only of those applicants for new or renewal NPDES permits who are identified by EPA as being collectively responsible for 80 percent of the discharges of any such pollutant.

These provisions imply that there are at least 20 identifiable pollutants for which discharge limits are too high. If so, EPA already has the authority to lower them, within the limits of available technology. But identifying the pollutants and the dischargers to be covered will place a tremendous additional burden on EPA and is likely to lead to protracted legal wrangling which may in fact delay pollution prevention efforts.

I believe that a simpler and more effective way to move towards the act's goal of eliminating pollutant discharges would be to require that all applicants for new or renewal NPDES permits and indirect dischargers prepare pollution prevention plans as outlined in Section 205 and guidance to be issued by EPA, but allow them some flexibility to suggest which pollutants are to be reduced, by how much and in what ways. The adequacy of the plans in terms of localized water quality needs could be determined as part of the permit approval process.

I believe that such an approach, along with my proposed NPDES amendment to protect against indirect discharges through groundwater contamination, would provide an effective, hydrologically consistent program for further significant reductions in point source pollution of the nation's waters.

Nonpoint Sources of Pollution

The act's provisions to prevent pollution from nonpoint sources also need to be strengthened. EPA's most recent water quality inventory report in 1990 found that water quality has improved in many locations during the last 20 years, but one-third of the assessed U.S. waters still do not fully meet state water quality standards -- despite billions of dollars spent to control discrete point sources of contamination. According to the report, more than half of the

remaining pollution entering the nation's waters comes from activities that discharge pollutants through diffuse, nonpoint sources.

A reauthorized Clean Water Act must do a better job of preventing nonpoint source pollution both from runoff to surface waters and leaching to groundwater, if the act's water quality goals are to be realized in a cost-effective manner. The current Section 319 program has had mixed success in large part because the program lacks teeth. There is little in the section to require states to alter the activities which cause pollution from nonpoint runoff or leaching. EPA has limited control over what goes into the state program plans. If a state does not develop a satisfactory Section 319 plan, EPA's only leverage is to withhold grant monies for plan implementation. There is no cross-compliance provision where a state would lose funds under other water-related programs for failure to comply with Section 319.

There are several ways the act should be amended to strengthen Section 319. States should be required to demonstrate the enforceability of their nonpoint source control programs and to include implementation milestones. Eligibility for state revolving loan fund (SRF) and other Clean Water Act-related monies should be subject to reduction if a state fails to fully comply with Section 319.

I also recommend amending Section 319 to require that state nonpoint source plans adopt a pollution prevention-based approach. Such plans should not rely solely on traditional best management practices (BMPs) that use structural or technology-based methods to control the volume of runoff that reaches streams, or that treat it before it reaches streams.

Instead, they should focus on an array of operations and process changes which would reduce the availability of pollutants for runoff and leaching. For example, preventive BMPs should include slope and vegetative cover considerations in construction activities. They should include integrated farm resource management plans which include alternative cropping systems, crop rotations and soil testing to minimize chemical use and prevent erosion. These plans should be similar in principle to the point source pollution prevention plans proposed in Section 205 of

S.1114. In general, BMPs in Section 319 plans should not result in the equivalent of an end-of-the-pipe approach for nonpoint sources.

To make the entire program more workable, I endorse the changes recommended by Water Quality 2000.³ While S.1114 attempts to improve the nonpoint source program, it fails in the following critical respects:

- * Planning and enforceable implementation of preventive actions for potentially polluting activities should be mandatory for all states.
- * Leaching to groundwater as well as runoff should be included in plans and preventive actions.
- * Implementing site-level integrated farm resource management plans to prevent pollution should be required for all farms in watersheds where water quality is impaired or at risk due to farm-related pollution. Application of national BMPs, as proposed in S.1114, would not provide pollution prevention gains equivalent to those of individual site-level assessments of operations and process options.

Preventing Pollution by Using Water Efficiently

The potential for conservation and increased water use efficiency to help achieve Clean Water Act goals goes beyond maintaining stream volume and flows. As population increases, pressure is growing on limited freshwater resources and on wastewater treatment funds. Increased water use efficiency can help to protect and restore our nation's waters by reducing this pressure and ensuring a cost-effective use of existing water supplies and SRF monies.

³ See pages 17-21 and 51-53 of the report, *A National Water Agenda for the 21st Century*, which has previously been provided to the Subcommittee.

Water use efficiency also can be a pollution prevention tool. For example, efficient water use can reduce flows to wastewater treatment plants thus reducing the likelihood and duration of combined sewer overflows and their resulting water quality impacts. A recent EPA-sponsored study found that conservation is likely to improve the performance of wastewater treatment to some extent.⁴ The same study found that water conservation can result in substantial savings for communities facing the need for significant capacity expansion or additional treatment by downsizing or delaying new capital investment.

One example of such savings occurred in Goleta, California. During the recent California drought, the city was faced with serious water supply constraints. In response, the city implemented an aggressive and extensive water efficiency program that reduced water use 50 percent. An unexpected benefit was significantly reduced loads to their wastewater treatment facility. Input declined by more than 40 percent. As a result, the city was able to forego building a multi-million dollar wastewater treatment expansion.

Another example involved San Simeon, a California tourist community with such a severe drought-related water shortage that the closing of its motels was being considered. Instead, the community decided to install water conservation devices on all toilets and showers and to eliminate irrigation. As a result, total water use was reduced by 39 percent; there were no sewer blockages; wastewater system performance was so improved as a result of decreased flows that a planned expansion was delayed for 7 years, saving \$750,000; and drinking water plant expansion costs were reduced from \$3,500,000 to \$600,000.

Water conservation also can decrease the cost of wastewater treatment chemicals and reduce the energy costs associated with treating and pumping water. The potential for energy cost savings is significant. A recent study found that in some California cities, energy costs

⁴ *The Effects of Water Conservation on Water Utilities*: Summary prepared by U.S. EPA Office of Policy Analysis, June 1992.

associated with municipal water supply and wastewater treatment exceed 50 percent of total municipal utility expenditures.⁵

I am pleased to see that Section 205 of S.1114 requires some applicants for new or renewal NPDES permits to address water use efficiency in their pollution prevention plans, but, as previously noted, I think that such plans should be required for all such applicants.

In view of the potential savings in the estimated \$137 billion needed for capital improvements in wastewater treatment facilities over the next 20 years, according to EPA's latest needs survey, and the rapid growth in municipal utility fees, I recommend that the act be amended to direct EPA to set minimum water efficiency standards for water and sewer utilities and to condition permits, grants and SRF loans for new or expanded wastewater treatment facilities upon meeting such standards.

In addition, I recommend that the act explicitly authorize the use of SRF funds for water conservation programs, alternative treatment systems which employ less water-intensive approaches, and the recycling and reuse of wastewater where practicable and economical.

Some utilities have undertaken major water efficiency programs, and many other state and local entities are interested in opportunities to reduce water use, but lack information and the technical resources to plan and implement such programs. I therefore endorse the provisions in S.1114 to establish a clearinghouse for information on water conservation and to provide technical assistance to state and local governments and water utilities to improve water use efficiency.

⁵ *Energy Efficiency Report*, California Energy Commission, October 1990.

**THE CLEAN WATER ACT SHOULD INCORPORATE WATERSHED UNITS AS
THE MECHANISM FOR INTEGRATING AND MANAGING SURFACE AND
GROUNDWATER AND WATER QUALITY AND QUANTITY FOR
COMPREHENSIVE PROTECTION OF THE NATION'S WATERS.**

Watersheds are the natural routes of surface waters that drain an area and are generally connected with groundwater aquifers. Interactions between land use, water use, ground and surface water quality, and aquatic habitat generally occur within a watershed. Also, in a given watershed there may be thousands of pollution sources ranging from farming operations to municipal storm sewers.

As a part of Water Quality 2000, EESI joined the growing consensus that watershed areas should be the basic planning and implementation unit for protecting the nation's water resources. I believe such an approach offers the opportunity, in a workable geographical area, to develop comprehensive pollution prevention and integrated water resource plans which reflect the interconnections between groundwater and surface waters and the interrelationships between water use and water quality.

A watershed approach allows involvement of the widest array of perspectives in the planning and management process. It can facilitate the integration of state water quality programs into state water allocation decisions. Perhaps most importantly, this approach allows limited financial resources to be targeted at the worst problems or those for which the greatest water quality improvement can be expected.

There are a number of reasons why a watershed-based approach may be effective. First, because watersheds frequently cross political and geographic boundaries they may be the best scale on which to address nonpoint sources, which also frequently cross political and geographic boundaries. Second, the watershed approach seeks to maximize the effectiveness of all levels of government -- federal, state, tribal and local -- by allowing each to do what it is best equipped to do on a cooperative basis. Such cooperation is particularly important because many nonpoint

sources of contamination result from land use patterns which are traditionally regulated by state, local or tribal governments. Third, a watershed-based approach can undertake broad-scale water use efficiency measures which have a greater chance of enhancing instream flows and protecting aquatic habitat than smaller, isolated efforts.

As a member of Water Quality 2000, EESI endorses its specific recommendations for a new, nationwide watershed program.⁶ In particular, I urge the Subcommittee to make watershed planning and management mandatory, not voluntary as proposed in S.1114. In addition, I do not believe S.1114 is clear as to whether a state electing to designate a watershed management unit and develop a management plan would be required to include groundwaters hydrologically connected to the designated surface waters.

As EPA Administrator Carol Browner noted in her testimony on CWA reauthorization to the House Committee on Public Works and Transportation:

"We are increasingly finding that in certain watersheds ground water recharge to surface waters can be a critical factor in determining the ecological health of aquatic systems. We need to ensure incorporation of ground water in our watershed approach where it significantly influences surface water quality, and we need to guard against the possibility of transferring a pollution problem from surface water to underground sources of drinking water."

I believe it is imperative to the success of the watershed approach that consideration of the potential for pollutants to leach to groundwater and then discharge to surface waters be an integral part of all planning and management activities. I therefore recommend that Section 302 of the bill be amended to clearly require that designated watershed management units and plans incorporate groundwaters that are hydrologically connected to designated surface waters. And, where groundwater aquifers transcend watershed boundaries, cooperative arrangements between

⁶ See pages 32-39 of *A National Water Agenda for the 21st Century*.

watershed areas should be required so that each watershed plan can effectively protect these regional aquifers.

As previously stated, I recommend that the comprehensive watershed management provisions of S.1114 be amended to incorporate water use efficiency and instream flow requirements. Otherwise, they will not be truly comprehensive. I also recommend that the bill be amended to require that the Section 319 nonpoint source prevention planning and implementation activities be incorporated into designated watershed management area plans.

In conclusion, I was pleased to see that the bill provides for technical assistance and some forgiveness of principal on SRF loans for small, economically disadvantaged communities and increased funding to Indian tribes for wastewater treatment works, planning and construction, and nonpoint source pollution management. Studies indicate that such communities are at a distinct disadvantage in competing for funds under the current SRF program.

Again, I commend the work of the Subcommittee. I believe its proposed revision of the Clean Water Act will improve and expand the nation's efforts to protect water quality. I hope the proposed changes I have outlined to recognize the impacts of the natural hydrologic system, to expand pollution prevention actions, and to plan and manage water quality protection on a watershed basis will help you to ensure that the act meets its goals.

Thank you for this opportunity to comment on the Clean Water Act reauthorization. We at EESI look forward to working with you and would welcome the opportunity to discuss our recommendations more fully.

ENVIRONMENTAL HEALTH COALITION

1717 Kettner Boulevard, Suite 100 • San Diego, California 92101 • (619) 235-0281 Fax (619) 232-3670

August 3, 1993

Senator Bob Graham, Chairman
 Environment and Public Works Committee
 U.S. Senate
 Washington, D.C. 20510

RE: Comments by San Diego Environmental Health Coalition for hearing record on S.B. 1114.

Dear Senator and members of the Committee:

The San Diego Environmental Health Coalition is a local, non-profit organization that lacks the budget to travel to Washington to give testimony but we request that our comments be made part of the hearing record on S.B.1114.

San Diego's reputation as a water recreation tourist destination is threatened by the pollution of San Diego waters. Lack of enforcement by our regulatory agencies, most notably the Regional Water Quality Control Board (enforcers of the current Clean Water Act) is the cause. In 1991, San Diego County had 382 beach closures including 3 permanent closures--almost half of the closures in the State. The opening of the tourist season was marked with the posting of the Pt. Loma kelp bed, determining it off-limits to fishermen, surfers, and divers. San Diego Bay has been posted with a fish consumption health advisory since a June 1990 County Department of Health Study found elevated levels of PCB and mercury in some Bay fish. Some species of bay fish have high rates of physical anomalies and mussels register high levels of toxics in their tissue.

Environmental Health Coalition (EHC) is urging your support of a stronger Clean Water Act. We are especially calling for improved enforcement and mandates for elimination of discharges of toxic pollutants to our Nation's waters. Some of the examples below may illuminate the severity of the problem to you.

Discharge of toxic chemicals to waterways are allowed under the current Clean Water Act. In 1991, California industries reported

discharging 10,232,335 pounds of toxics to surface waters and 28,349,693 pounds of toxics to sewage treatment plants. California is in the top 10 for both discharges to sewer and surface waters. Toxic chemicals, even in low concentrations, can bioaccumulate in fish and make them unfit for human consumption, cause deformities in juvenile fish, or cause total reproductive failure. From 1990 to 1992 there were fishing bans or advisories in force in over 720 locations in the U.S.

SAN DIEGO BAY TOXIC POLLUTION

Locally, Environmental Health Coalition is calling for action to cleanup waterways to a fishable and swimmable state. San Diego Bay suffers from toxic hotspots including the highest levels of PCBs in sediment on the West Coast and significant contamination from naval facilities located around the bay.

San Diego Bay has been posted with a fish consumption health advisory since a June 1990 County Department of Health Study found elevated levels of PCB and mercury in some Bay fish. The study also found evidence of radiation. Follow-up studies to examine dioxin levels and further characterize extent of contamination of fish were recommended but have yet to be done.

San Diego Bay has suffered tremendous losses of natural wetland and upland habitats. We must protect what is left. Already one third of the Bay has been filled in, and San Diego Bay has lost 92% of salt marsh habitat, 81% of intertidal flats, and 72% of shallow subtidal (0-6 ft MLLW) habitat. Virtually all of the upland habitat around the Bay has been converted to urban and industrial uses. How much more are we willing to lose? The current rate of wetlands loss nationally is 290,000 acres a year. Coastal wetlands are valuable to fish because they provide spawning and nursery habitat for 60 to 90 percent of the country's commercial fish catch.

THE SAN DIEGO REGION SUFFERS FROM LACK OF ENFORCEMENT OF THE CLEAN WATER ACT

One strong example of the correlation between the lack of enforcement and pollution in the waters can be seen in the recent nomination by Governor Pete Wilson of Mary Jane Forster to the State Water Resources Control Board. Environmental Health Coalition has monitored the Regional Board meetings for the past 5 years. Mrs. Forster has been a member of the Regional Board since 1984. During this time she has often determined the degradation of water quality in the San Diego region as an inevitability. She has used this rationale for allowing continued pollution of native waters. That she has been nominated for promotion speaks to the fact that states cannot be solely relied upon to protect water quality.

Mrs. Forster's overriding concern and greater sensitivity for polluting industries over the use of native waters by the common citizen is frequently evident. A serious example of this was her comments in a July, 1987 hearing on the Van Tol Dairy Expansion. The dairy was far out of compliance with current waste discharge requirements and was requesting an expansion of their operations. The dairy was suspected of polluting drinking wells of residents. Mrs. Forster said, "In agriculture areas,

people should give their children bottled water." This let-them-eat-cake-and-drink-bottled-water ethic that Mrs. Forster has often proposed, is not what we expect or deserve from the regulatory officials that are in charge of protecting our State's water quality. (See attached article)

She has also stated on the record that the goals of "no net loss" are "not good" and would be "suicidal" for the Regional Board to try to follow. The downward spiral of water quality and loss of wetlands in the San Diego region should be no surprise given this hostile attitude toward the environment by our regulators.

The Regional Board regularly makes decisions that are non-protective and inappropriate and enforcement has been, too often, nonexistent. They have chastised their staff for trying to bring impending violations to the Board's attention. This Regional Board has turned a blind eye to City of San Diego violations of their Pt. Loma sewage treatment NPDES permit for 28 out of the last 60 months. This has resulted in tons of illegal sludge disposal in the ocean. For example, in March 1992 651 dry tons of suspended solids over permit limit were discharged to the ocean at Pt. Loma. The Regional Board has known about these violations for over a year and taken no action at all. (See attached documentation)

A 1991 EHC review of self-monitoring and compliance records of 19 NPDES permit holders around the Bay revealed significant lack of enforcement. Of 222 violations, only 2 fines were imposed. One percent enforcement is not adequate and will not result in clean water.

Other disturbing actions follow:

Eastern Municipal Water District NPDES permit-

In 1992, the Regional Board completely abdicated their responsibility to enforce the law requiring EPA to take over administration of an NPDES permit for Eastern Municipal Water District. The Board refused to adopt a permit that had a chronic toxicity standard. This is especially interesting given that the discharge was to provide a live-stream restoration.

Hazardous Waste Strike Force

In July of 1992 the Regional Board was removed, by the FBI, from the Hazardous Waste Strike Force for unwillingness to participate. A year later, they have yet to be reinstated.

Spanjian Inc.

The Regional Board allowed a discharge of TCE to remain in a groundwater basin designated as drinking water in levels 80 times above Title 22 standards.

Mr. Chairman and members of the committee, we need your help. We need a stronger Clean Water Act one that will require enforcement, pollution prevention, and result in clean water!

Thank you for the opportunity to comment on this very important legislation.

Sincerely,

A handwritten signature in black ink that reads "Laura Hunter". The signature is written in a cursive, flowing style.

Senator Barbara Boxer

SAN DIEGO BAY FACTS

San Diego Bay has lost:

92% of Salt Marsh habitat

81% of intertidal flats

72% of Shallow subtidal (0-6 ft MLLW) habitat

Virtually all of the upland habitat around the Bay has been converted to urban and industrial uses.

Black Skimmer, Caspian Tern, and Least tern eggs have been found to contain DDE and PCBs.

Significant mortality and growth impairment was observed in sand dollars, polychaetes, and surf smelt when exposed to sediments from 3 sites in San Diego Bay.

Over 11 million cubic yards of dredging is anticipated in the next few years from Navy dredging projects alone.

The Pt. Loma Kelp bed is facing a quarantine for several months, just as summer begins.

The San Diego Port Master Plan has been amended over 16 times. Environmental and public interest groups have called for comprehensive planning of the Bay to ensure its ecological viability.

South San Diego Bay appears to be an important nursery area for juvenile California halibut and possibly for the young of spotted and barred sandbass and other species. Young of the year and larger juveniles of the white seabass (Atractoscion nobilis) have been taken in samples from South San Diego Bay during recent years. This is particularly significant because the population of white seabass in southern California apparently has been reduced significantly by over fishing or other causes.

San Diego Bay is the only place on the West Coast where Pacific Green Sea Turtles congregate.

The Bay supports an impressive number of species, including 9 endangered species, over 100 species of waterfowl and shorebirds, and 90 species of fish and shellfish. The mudflats of the south Bay are a significant stopover for migrating birds on the Pacific Flyway.

Only South Bay has significant areas of marsh, mudflats, and salt ponds. Freshwater inflow has been diminished by dam construction, extensive groundwater use, diversion of the San Diego River, and prolonged drought conditions.

STATEMENT of

FRANK F. FASI, MAYOR
City and County of Honolulu

before

SENATOR ROBERT GRAHAM, CHAIRMAN
and Members of the Subcommittee on
CLEAN WATER, FISHERIES AND WILDLIFE
UNITED STATES SENATE

August 4, 1993

Senator Graham, Senator Chafee and Members of the subcommittee, I am C. Michael Street, Chief Engineer and Director of the Department of Public Works of the City and County of Honolulu here on behalf of the City and Mayor Frank F. Fasi. I am here to testify on Senate Bill 1114, the Water Pollution Prevention and Control Act of 1993, a bill to amend and reauthorize the Federal Water Pollution Control Act.

The reauthorization of this Act is of critical importance to everyone across America concerned with protecting our precious and fragile environment. In his comments introducing this legislation, Senator Baucus called it a reauthorization "debate" and recognized it as a microcosm of the general debate about how best to protect the environment. He said this legislation will not satisfy those on the extremes of the debate, because it is designed to take a balanced, cooperative approach to solving the Nation's environmental problems. The City and County of Honolulu is pleased to participate in this cooperative effort.

Our City is in the center of this great debate because we have been victim to "Clean Water Act" lawsuits by citizen groups to the tune of \$500 million. There is irony in this because two of the City's wastewater treatment plants won gold and silver awards from the National Association of Metropolitan Sewer Agencies.

Environmentally, Honolulu ranks highest in the nation by many standards and has won awards for the outstanding quality of life provided for its residents and visitors. Honolulu was named the healthiest of America's 100 largest metropolitan areas in the 1992 Livable Cities Almanac, and was also ranked 7th out of 300 American cities with populations over 500,000 as most livable by Money magazine. World Resources Institute's Environmental Almanac named Honolulu America's No. 1 Green City in 1992 and No. 1 Green Metro Area in 1993. We must be doing something right!!

The City and County of Honolulu has a resident population of 861,000 and consists of 620.5 square miles. The deep, blue Pacific Ocean completely surrounds the island, and is a precious resource, along with pristine waters from our mountain dikes and caprock aquifers. Some overzealous environmental activists suggest by their actions and statements, that we take this God-given gift for granted, and have allowed its degradation.

They are wrong! Honolulu has taken these priceless treasures under fervent stewardship and protection for many years.

Since 1972, the City and County of Honolulu has spent \$1.7 billion on waste water. This amounts to \$109.77 per year for every man, woman and child in the City. Next year alone, the City will spend \$205 million on wastewater treatment and disposal.

The Clean Water Act's expectations translate into an ever growing financial commitment on the part of local government. Over \$23 billion will be required for cities to meet the current requirements of the Clean Water Act to the year 1995. Cities such as Honolulu pay 80-90 percent of the cost in order to comply with the requirements. Operation and maintenance costs, which are totally paid by the local taxpayers, are

expected to double every eight years. Historical data show that annual household use fees will, at a minimum, double every six years.

In Honolulu, sewer rates have increased by more than 40 percent. It has cost a typical Honolulu family of four nearly \$300 for sewer fees and nearly \$263 annually for water, totaling about \$563 annually. As of July 1, 1993, sewer fees have increased to nearly \$412 annually per household to comply with federal environmental laws. Water fees also have been increased to nearly \$295 yearly. Honolulu residents will be paying nearly \$707 for sewer and water -- \$144 more than last year. Honolulu has beat out Boston residents, who were paying the nation's highest water and sewer rates. A typical Boston family of four pays \$590 each year for water and sewer. Boston expects its water and sewer rates to to \$1,300 per household by 1999. Honolulu can expect the same unless something is done.

Increased federal funding for the State Revolving Funds program, as proposed by S.B. 1114 will greatly assist the City and County of Honolulu. We must complete some expensive and important projects to meet compliance deadlines, especially in the area of sewer rehabilitation as it relates to infiltration and inflow problems.

However, the bill's provisions for fees will cause Honolulu's taxpayers, and probably those of other municipalities and cities, additional financial burden. Permittees should not be required to pay fees for enforcement, state water quality monitoring, development of water quality standards, modeling, planning, etc., and public information systems. These should be supported by federal or state general funds.

Senator Baucus' comments for himself and for Senator Chafee in introducing the proposed new Water Pollution Prevention and Control Act stressed a desire to achieve environmental progress through the use of sound science and sound economics. We agree with Senator Baucus and ask for legislation arising from real, rather than perceived, environmental problems.

Public policy decisions driving the Clean Water Act requirements should be based on tested, proven scientific facts to prevent the type of unsubstantiated fear and environmental hysteria gripping some citizens of this nation. We ask for funded, researched, fact-based legislation, responsible to local taxpayers and which can be translated into practical, reasonable and necessary regulations.

As we look back on 20 years of environmental regulation, we find much that is well-meaning and that has been effective for the nation. But as with all programs, some parts can be found to be working better than others. Environmental laws which impose the same conditions, restrictions, requirements and consequences on all without taking into account the real and inevitable differences in regions and the degree of actual harm caused, are fatally flawed laws. When the same intensity of scrutiny and consequence is applied to a one-gallon sewage spill in Honolulu as is applied to a chemical leak from a rail car in California or a nuclear plant release in Pittsburgh, the intent of the law has clearly been lost. The Clean Water Act should take into account the wide ecological variations in different geographic locations. What makes sense for eastern seaboard cities or land-locked middle western states may not make sense for an island such as ours located in the middle of the Pacific Ocean. The Clean Water Act should be flexible to accommodate these

variations if it is to make any sense. Scientists would agree that it currently fails to do this.

The City and County of Honolulu is the only city in the United States completely surrounded by deep ocean water, which is discharging sewage effluent through a deep ocean outfall. This is a truly unique regional difference that requires accommodation in the law. The conditions creating the waiver from secondary treatment provision in the Act still exist. Accordingly, we request amendment to the Act allowing for reinstatement of the 301 (h) waiver application program.

There are two aspects of the law regarding provision for citizen suits, with which Honolulu has had experience and recommends amendments. While legislative history indicates that Congress directed EPA to withhold enforcement action against waiver applicants during the pendency of their application, there was no such prohibition against citizen groups.

Honolulu has been sued twice, by environmental groups, with the National Sierra Club Legal Defense Fund being a principal instigator. Both lawsuits arose due to the fact that the City's 301 (h) waiver permit application had undergone over 12 years of review by both EPA and the State of Hawaii, Department of Health. In other words, Honolulu's first 301(h) Permit application submitted to EPA in 1979 took over 12 years!

When the City's permits were finally issued in 1990 and 1991, environmental activists challenged EPA's decision to issue the City a 301 (h) waiver. This challenge prevented the waiver permits from going into effect. These same environmental groups then sued the City in both cases in federal court based on the argument that there was no waiver permit in effect. Based on its interpretation of the Clean Water Act, the Court

found the City liable for violations of treatment requirements, although there was no evidence of any measurable harmful impact to the ocean. Combined, the City's exposure in the two cases was \$500 million. Something is clearly wrong with the laws and regulations which allow this kind of situation to occur. Even the Court recognized the illogical consequence for the City.

Similarly, the current Citizen Enforcement provision in the Act as interpreted has provided a feeding frenzy for citizen groups at great and unnecessary expense. In Honolulu, the courts have interpreted the Citizen Enforcement provision of the Act to allow citizen groups to go forward with their lawsuits based on allegations of violation.

Honolulu went to trial in 1993 for a violation that occurred in 1989 and never occurred again. The Court determined that allegations of a violation were enough to keep the case in court, even though the citizen group was never able to prove another violation of the same nature and that no harm was caused to the ocean or public health.

The Clean Water Act's objective should be to encourage permittees to take mitigative measures to prevent violations, not to encourage costly litigation.

The City and County of Honolulu has presented to this Subcommittee, a package of proposed amendments to the Clean Water Act. It contains references to the key points I have outlined here, but it also appeals for changes in other provisions of the Act including: 1) Criminal prosecution for negligence in operation and maintenance of publicly owned treatment works and 2) Reestablishment of the timetable for stormwater and other municipal discharges.

The current law suggests that a violation of a permit conditions carries criminal sanctions. Regulatory requirements imposed on individuals who have the responsibility for operating and maintaining sewer treatment facilities have become more extensive, strict and complex. A technical violation of any of those requirements presents exposure to criminal prosecution. This is a constant threat regardless of whether treatment plant operations have caused actual harm. The law should be changed to find actual injuries to persons or property damage. Furthermore, the Clean Water Act already contains provisions for "knowing violations" and "knowing endangerment" which are more than adequate to deal with polluters in a criminal context.

Also, it needs to be pointed out that cities such as Honolulu are exposed to potential lawsuits at the risk of millions of dollars regarding compliance with the stormwater provisions of the Clean Water Act.

EPA's implementation of its stormwater regulations was not synchronized with the deadlines established in the Clean Water Act. Although there existed a statutory requirement to regulate stormwater in the clean Water Act, EPA was unable to promulgate the regulations establishing the procedure for the stormwater requirements. This has left cities in an impossible situation, without the means to comply with the Clean Water Act and its deadlines for stormwater requirements. Ultimately, cities are vulnerable to costly litigation. Violations of stormwater requirements carry a high price tag -- \$25,000 per day per violation. This situation needs to be corrected.

In closing, we stress that we not lose sight of common sense. The current law makes dealing with life and property threatening emergencies impossible. For example, if

firefighters are to extinguish a burning truck on the road, must they be forced to first get a permit because liquids may get into the storm system? Or do they do their job and risk facing jail time because getting a permit would mean losing lives? What about an airline accident? Should the firefighters wait to process the documents before they save lives? Or do they go to jail because they've broken the black letter of the law? What about the common occurrence of dewatering when sewer lines break, which is not unusual. What do City employees do in these emergency situations, when faced with the choice of having to obtain a permit or going to jail? If any of you doubt what I am talking about, then I invite you to talk to any of our people who work daily in the areas affected by the Clean Water Act.

On behalf of Mayor Frank Fasi and the people of the City and County of Honolulu, I thank you for your kind attention to our testimony. We hope this Subcommittee will consider our requests and proposals for amendments to the Clean Water Act.

CWA-TESTIMONY

September 17, 1993

The Honorable Max Baucus
 Chairman
 Senate Committee on Environment & Public Works
 SD-456, Dirksen Senate Office Building
 Washington, D.C. 20510-6175

In Re: Clean Water Act Amendments / Enforcement
 Proposal to reinstate provision to impose
 retroactive penalties via Citizen Suits
for corrected exceedances of permit limits

Dear Mr. Chairman:

The Independent Liquid Terminals Association, is an international trade association which represents 87 companies with more than 400 domestic for-hire bulk liquid terminals that operate in 44 states, Puerto Rico, and the District of Columbia. These companies range in size from as small as 10,000 bbls. of storage capacity to those with 5 million bbls. or more of storage capacity.

ILTA Member for-hire terminals are different than facilities owned by an oil and chemical companies which own and market those products. For-hire terminals do not own the products stored at the facilities. Instead they lease storage tank space to product owners and earn their total revenue from this service to product owners.

Issues of Concern

Among the issues ILTA is concerned with are the following major issues:

1. Retroactive law suits are historically revisionist, imposing today's environmental and equipment standards for regulatory situations which occurred as far back as 10 or more years ago.
2. The huge retroactive financial penalties imposed are unrealistically based on percentages of chemicals discharged when in fact, the actual volumes discharged are minuscule.
3. The retroactive financial penalties are unrealistic in other ways. Failure to make purely technical and routine statements in permittees monthly reports have been treated as major environmental violations.
4. These retroactive law suits and financial penalties can bankrupt a company, particularly small and medium size companies and result in unemployment and loss of a productive business.
5. Since the Clean Water Act stacks the law in favor of those bringing the retroactive law suit, defending such a suit appears to be futile. Therefore, alleged violators feel that the retroactive law suits are used as environmental blackmail to force a less-expensive settlement with the plaintiffs.
6. Retroactive law suits brought for past violations which have been abated and corrected do not bring a company into compliance -- that company is already in compliance -- the suit is brought only because the law allows those bringing it an easy way to extract money from a business.

INDEPENDENT LIQUID TERMINALS ASSOCIATION
 1133 15th STREET, N.W., SUITE 650
 WASHINGTON, D.C. 20005 • 202-659-2301

Issue 1: RETROACTIVE LAW SUITS ARE UNFAIRLY REVISIONIST

Retroactive citizen law suits represent a revisionist legal approach in that they are a structured effort to go into the past and redress permitted water discharge violations by measuring them against today's standards, experience, equipment capability. Today, vast improvements in technology, modernization of facilities, and better water treatment practices have improved the water discharges to the point where they meet EPA's requirement that the water discharged be cleaner than drinking water.

Since equipment and devices that measured chemicals in extremely minute quantities as parts per million or parts per billion were not that accurate, regulatory agencies in the past, including the State of New Jersey, allowed permittees to a gray area tolerance level -- an exceedance slightly above the permit level. The regulatory agencies sent warnings instead of imposing fines, and advised permittees to bring their discharges within permitted levels. Only if the discharge exceeded the grey area limit would the regulatory agency impose a fine.

Now, revisionists would go back into time and demand that companies be fined and penalized millions of dollars for yesterday's violations based on today's advances in equipment, improvements in operating practices, and in changes of regulatory agency philosophy.

Issue 2: RETROACTIVE FINANCIAL PENALTIES SHOULD NOT BE BASED ON PERCENTAGES OF EXCEEDANCES

For example, if a permit requires that a company discharge no more than 4 parts per million of a particular chemical, and a company's discharge is 6 parts of the chemical per million of parts of water, this is a 50% violation of the permit limit. If the exceedance is 8 parts per million, then the violation would be 100% of the permit limit. However, the actual volumes of chemicals discharged are minuscule. With a 4 parts per million permit level, a facility would have to discharge 250,000 gallons of water to yield one (1) "accumulated" gallon of the chemical pollutant being regulated.

Thus, basing a penalty on the exaggerated perspective of "percentage of the permit level exceeded" is a grossly unfair method of measuring an appropriate penalty. Also, when dealing with parts per million, or parts per billion, imposing such huge penalties on such small total volumes of chemicals discharged is equally misleading and unfair.

Issue 3: THE ABSENCE FROM PERMITTEE'S MONTHLY REPORT OF PURELY ROUTINE STATEMENTS SHOULD NOT BE MAJOR VIOLATIONS

Discharge reporting must comply with all applicable federal, state, and local laws, regulations, and requirements. For example, a Sanitary Sewage District required that all dischargers report any discharge of petroleum including any sheen on the water. A permit holder was charged with a major penalty for a failure to declare in its report on a permitted discharge of a particular chemical (at 5 parts per million parts of water) which had traces of petroleum in it, that the permitted discharge resulted in "... a sheen on the water."

In this instance, the person making the report was unaware that the 5 parts per million of chemical would yield traces of oil. Whether 5 parts per million resulted in a visible sheen upon the water is pure conjecture although technically the oil may have been present even though not visible. To resort to imposing high fines for such technical violations undermines the permittees confidence and trust in the fairness of the regulatory and judicial systems.

(more)

Issue 4: RETROACTIVE LAW SUITS CAN BANKRUPT A NOW-COMPLYING COMPANY

A company which has invested in pollution control equipment to bring its permitted discharges into line with its permit levels can be bankrupted by retroactive law suits for past corrected violations. This is particularly true of the service industries which earn a much lower amount of revenue than do product manufacturers which earn their revenue from the sale of products.

For example, the costs and penalties associated with defending such a retroactive citizen's suit can result in a minimum of \$5 million and upward to cover attorneys' fees and penalties. Consequently, a formerly financially healthy company, now in compliance, and providing jobs and paying local, state, and federal taxes, may be forced into bankruptcy or put on the brink of financial disaster. They may never be able to recover. Such suits can put small and medium-size companies out of business.

The loss of jobs and taxes seems to be a huge social penalty for society to absorb, particularly for companies that have subsequently achieved compliance with their permit requirements.

Issue 5: THE NATURE OF THE RETROACTIVE LAW SUIT UNDERMINES THE CONFIDENCE OF THE PERMITTEE IN THE REGULATORY AND JUDICIAL SYSTEM

Generally, the experience yielded from attempting to defend against retroactive citizen law suits under the Clean Water Act is to settle the suit with the plaintiffs. But industry does not view it as a settlement, but as an action under the law that allows the plaintiffs to twist the defendant's arm until the defendant agrees to pay off the plaintiff. These appear to be similar to the shareholder takeover battles -- the greenmail law suits in the commercial arena -- and we have seen what a devastating financial impact they have had on corporations. While proceeds from settlements have been delegated to fund projects of environmental groups, any benefits from funding such a project as a hiking trail, are more than offset by loss of jobs and taxes, and government payouts to people who become unemployed as a result of such suits.

Issue 6: EXPENSIVE RETROACTIVE LAW SUITS FOR PAST BUT CORRECTED VIOLATIONS DO NOT BRING INTO COMPLIANCE A COMPANY THAT IS ALREADY COMPLYING

The plaintiff "environmental" groups that bring retroactive law suits against companies that have abated and corrected past violations are not performing a useful citizens' service.

Most companies in recent years have come into permit compliance because two parallel forces have emerged. The states have been doing a better job in urging compliance with permit requirements by threatening not to renew permits until deficiencies are corrected at a facility, and better water treatment equipment and practices have enabled the companies to maintain operations within permit limits.

Thus, companies with past corrected violations now ask, "How can a retroactive law suit for a past violation bring us into compliance? We are already in compliance." They ask, "How can taking money out of our pockets and placing us in a precarious financial position serve to improve water quality?"

The retroactive law suit against past abated and corrected violations is a dangerous practice and should not be allowed to creep back into the law. The better approach is to improve state inspection of facilities and state enforcement of the water laws. All law suits of merit should be prosecuted by the state. The state should not have to rely on citizen organizations to prosecute them. It smacks of "vigilantism" and it got out of control in the past. The Gwaltney case decision and other court decisions should not be overturned to allow retroactive law suits.

Citizen suits should be restricted to actions for continuing repeated violations and not violations that have been abated and the conditions causing them corrected.

(more)

Other Issues:

7. ILTA supports the existing 3rd Circuit Court decision that require plaintiffs to show that the defendants discharged a pollutant which causes or contributes to the kinds of injuries alleged by the plaintiffs.
8. ILTA believes that plaintiffs in a citizen suit, among other things, should continue to be required to show in court (a) an actual injury in fact that (b) is directly traceable to defendant's conduct. Plaintiffs should be required, to show to a scientific certainty that defendant's discharge was a pollutant that caused the plaintiff's injury.
9. The definition of "citizen standing" should not be broadened. To broaden it any further would make it meaningless as a factor a court would have to consider when a citizen's suit is brought.
10. Citizen suits, current or retroactive, should not be allowed for discharges to publicly-owned treatment works (POTW's). POTW's have their own methods for controlling dischargers of pollutants, for treating pollutants, for prohibiting improper discharges, for requiring pretreatment of discharges, or and for charging fees for the treatment of discharges.

Conclusion:

The Independent Liquid Terminals Association believes that retroactive citizen suits have much potential for abuse and that their use has been much abused in the past. Permit holders who have abated their past violating discharges and who have corrected deficiencies leading to these violations should not be subject to retroactive citizen suits.

Citizen suits should be limited to continued and repeated violations only. Allegations by proponents that "all a violator need do is stop exceeding its permit level once it becomes aware that it might be subject to a citizen's suit defeats the suit," is incorrect. Further, allegations by proponents that a permit violator can then continue to discharge in exceedance of the permit limit is also incorrect. Such activity would convince any court that the discharges in excess of the permit limit have not abated, that the deficiencies causing them have not been corrected, and that the violations are current.

Further, citizen groups that want to act as a watch dog for the state regulatory agencies can provide the state prosecutor with the information and evidence about current violations. State and federal agencies have the power through injunctions to halt operations by those who discharge in excess of permit limits. They can require the discharger to correct the deficiency.

We should not encourage retroactive citizen suits. These suits are brought against companies who voluntarily and honestly reported on a monthly basis their discharge levels to the state regulatory agencies. Because companies have done much to keep their permitted discharges within permit limits, their are fewer opportunities to bring citizen suits against permittees today. However, past records of violations sit in regulatory agency files like ducks in a barrel.

Proponents of retroactive citizen suits, with their proposals to amend the Clean Water Act, are simply asking the Congress to make it easier to pick off sitting ducks. This should not be allowed. The amount of money sued for far exceeds any revenue any company may have saved whenever it exceeded a permit limit. Most of the permit violations were not willful. The EPA system is structured so that a company will be within permit limits about 95% of the time. Companies are usually within permit limits more than 95% of the time. (See Chemical Manufacturer's Association for how the system works.)

ILTA Comments on
the Clean Water Act
Retrospective Penalties/Citizen Suits

- 5 -

September 17, 1993

Only companies with past violations and current assets (money) are sued. Companies with past violations and no money are not sued. These sitting duck suits neither benefit the environment nor the national welfare and economy. This abusive and disreputable practice should not be countenanced by the Congress. It has no place in the Federal Clean Water Act.

Respectfully submitted,

Re: S. 1114, the Federal Water Pollution Control Act of 1993

August 12, 1993

Statement of Bob Giesler
President of the
Marina Operators Association of America
before the U.S. Senate
Subcommittee on Clean Water, Fisheries, and Wildlife
on S. 1114, the Federal Water Pollution Control Act of 1993

Thank you and good morning, Mr. Chairman and distinguished Senators. I am Bob Giesler, President of the Marina Operators Association of America and a marina owner/operator in South Haven, Michigan for 14 years. I am also a Board member of the Michigan Boating Industries Association.

MOAA is the national trade association of small businesses which provide marina services and waterway access to our nation's boaters. Our members include large multi-marina owned conglomerates, concessionaires on Army Corps of Engineers lakes, small individually or family owned marinas, dry stack storage facilities, service yards, and support services, such as manufacturers of boat docks and boat access ramps. However, the far majority of our members are the small, family owned marinas with fewer than 100 boat slips.

The strength of our organization is that MOAA members maintain frequent contact with recreational boaters. We perform service and maintenance work and sell and install accessories. Boat owners store their boats on our properties either in dry storage or docking facilities. Some even use our access ramps. Boaters tell our members what's on their minds; and, because our members are market driven, we strive to satisfy their concerns.

We greatly appreciate the opportunity to present testimony for the record on S. 1114, the Federal Water Pollution Control Act of 1993, more commonly called the Clean Water Act in our industry. We also commend your leadership and the interest of the Subcommittee in holding the weekly hearings this summer on Clean Water Reauthorization.

Under the leadership of the MOAA Board of Directors, our industry recognized the need for clean water to promote recreational boating. We believe boaters want to recreate on clean

water and anglers want to fish in clean waters. As such, the MOAA Board cosponsored a Washington conference called "Boating on Clean Water" on April 4 and April 5, 1993. The conference was also sponsored by the Marine Retailers Association of America and the Northwest Marine Trades Association.

Panelists from key clean water government agencies, such as the Environmental Protection Agency, the National Oceanic and Atmospheric Administration, the U.S. Coast Guard, the U.S. Army Corps of Engineers, and the Department of the Interior joined with Hill Committee staff, and representatives from the boating industry, environmental groups, and boating consumer organizations to review the direction policy makers are going regarding clean water. It became very clear at the conference that the boating industry wants to work with environmentalists and policy makers for the common goal of cleaning our waters.

Subsequent to the successful completion of the "Boating on Clean Water" conference in Washington, MOAA scheduled other conferences in Atlanta in August, in Chicago in September, and in Las Vegas in November. We are attempting to bring the excellent discussions of the national "Boating on Clean Water" conference to our membership and to inform key State and Federal government agencies about who and what our industry is at the local and regional levels. It is important that our industry and regulatory agencies understand what it is we can do to comply with Congressional intent and direction on Clean Water.

MOAA also formed a "Clean Water Reauthorization Committee" with membership from recreational boat dealers, marina operators, state boating regulatory agencies, and boat manufacturers to analyze S. 1114 and other bills introduced in Congress on Clean Water. Our committee met and drew an immediate consensus that recreational boating is dependent on clean water for recreational activities and abundant fish and wildlife resources for continued strength and economic growth.

Our members strongly support the intent of S. 1114 in its goal of attaining economically achievable solutions to the clean-up of our nation's waters. We support S. 1114, but ask consideration be given to certain questions, concerns, and recommendations very important to our industry.

The marina industry is a very special industry, because our members work, live, and recreate on the water. The vast majority of people in our industry invest in marina businesses because of a love of our water resources, including boating and fishing. However, the marina and boat yard industry, which is characterized by small, family owned and operated businesses, has an acute sensitivity to economically achievable pollution prevention measures. Environmental regulations must be subject to cost benefit analysis and technological feasibility. Our members want clean water, but there is also a fear of what, as small businesses they can afford to pay or pass on to boating consumers in increased

fees for services. What will the market bear without going out of business?

We are pleased with the general intent of S. 1114 regarding the references to the importance of "sound science and sound economics" and the acknowledgement of the financial burdens the Clean Water Acts of 1972, 1977, 1981, and 1987 have imposed on State and local governments. We ask that the committee also recognize the difficulties small business may have in complying with certain far reaching and broad provisions of the rewrite.

In particular, MOAA asks that Title I, Section 101 be amended to allow private marinas and boat yards to utilize State Revolving Funds or low interest government backed loans to assist with the installation of sewage pump-out stations, porta-potty dump stations, and boat washing wastewater treatment systems. Specifically, we request that section 603 (33 U.S. Code 1388(c)) be amended to read "(c)(1)(J) Constructing sewage pump-out stations, porta-potty dump stations, and boat washing wastewater treatment systems approved pursuant to sections 304, 312, and 319."

Another major concern with S. 1114 is the lack of financial accountability in section 201 in Title II regarding States authority to collect fees to administer and finance State water quality environmental programs. We commend the bill for requiring funds collected from applicable fees be used only by States to finance improvements in water quality. However, the bill lacks any requirement for efficiency and effectiveness in a State managed program. Without such safeguards, our fear is that programs of run away fee increases to orbital amounts similar to what has happened in Florida and Washington state will significantly impact marina operations. When a State ceases to look at fees as an offset to the cost of administering a well-managed program and begins to use fees as a sole funding source then fees become a tax and the cost of doing business will go unchecked. The boating industry will suffer with increased unemployment and a reduced capital basis.

We recommend a fee cap of \$500.00 to \$1,000.00 per permit.

We commend the committee for section 302 of Title III regarding the creation of a comprehensive watershed management program. We believe this approach to the prevention of pollution is sound, because it will bring point and non-point source reduction together. We have a deep concern a lack of consistency from marina to marina could result as each watershed management team drafts individual regulations for each watershed. With different rules, practices, fees, and requirements, boat yards in one watershed would not be able to offer services similar to one in another watershed. These differing marina services would result from differing fees and more expensive pollution abatement requirements. Unfair competitive advantages would result, and new concentrations of boats in areas providing "better" services could cause safety and congestion problems.

Section 304 of Title III requires the Environmental Protection Agency to create a National Program Guidance which would be very similar to the recent Nonpoint Guidance Manual implemented under the Coastal Zone Management Act. Representatives from our industry worked closely with the National Oceanic and Atmospheric Administration to develop a program which would work in waterfront marine facilities and also meet the intent of Congress. Problems continue to exist in this regard. With two different and sometimes conflicting programs for our members to comply with, those problems will multiply. We strongly prefer a single program. However, if Congress continues to support two programs in S.1114 with a dual EPA and NOAA approach, we ask that the interests of our industry be considered in the rule making process to simplify and clarify our ability to comply with the Clean Water Act.

Because our industry consists of small businesses, our members do not have the luxury of employing staff and lawyers to review regulations and learn how to comply to regulations, even though our members want to and will be required to under law. Title V contains a provision which we ask be expanded regarding education. An industry peer education program is needed to inform and educate people in the recreational boating industry as to their environmental responsibilities prior to being subject to the \$5,000.00 field citation in section 503. Section 519, "Clean Water Education," is ideal for the inclusion of the National CleanMarina Program. This program is a three year national nongovernment initiative proposed by a consortium of environmental organizations, boating consumer groups, Sea Grant Colleges, State and Federal government agencies and Departments, and the boating industry to help reduce incremental pollutant levels from marinas and recreational boat operations. It is a pro-active program in every state to assist through education only the marina industry and boating public to become more environmentally compatible.

MOAA strongly supports the CleanMarina program and asks that S. 1114 be amended to authorize this very important and much needed program to significantly reduce water pollutant levels coming from boating and marina operations, to accelerate the accomplishments of the Clean Water Act, to reduce the compliance costs of the industry, and to educate the boating public regarding sound environmental practices.

To conclude, MOAA congratulates you on your efforts to clean the water. We look forward to working with you and staff.

Thank you Mr. Chairman.

August 11, 1993

The Honorable Max Baucus
Chairman, Committee on Environment and Public Works
SD-456 Dirksen Senate Office Building
Washington, D.C. 20510-6175

Dear Mr. Chairman:

I am writing to ask that this letter be included in the committee record of the hearings held on S. 1114, the Federal Water Pollution Control Act of 1993, in the past couple of months in the Subcommittee on Clean Water, Fisheries, and Wildlife.

The 3,500 members of the Marine Retailers Association of America greatly appreciate this opportunity to submit written comments on S. 1114 and commend your leadership for reauthorizing this important legislation.

MRAA is the national trade association of small businesses which sell and service recreational boats and operate marinas. Our members come from virtually every state in the country, and MRAA is closely aligned with 119 regional, state, and local marine trades associations.

There may be no other industry so closely associated with the marine and water environment as we are. Our members work on the water, many times live on the water, and recreate on the water. People usually get into our business because of a love of water recreation and the outdoors. It is an industry with small margins and low profitability, but one that provides a great amount of personal satisfaction.

Our members consider themselves to be environmentalists and environmental preservationists. We strongly recognize the need for clean water to promote recreational boating. And, because a large percentage of our customers purchase and operate recreational boats for fishing, we support programs to protect and enhance fisheries and wildlife management. We are deeply concerned about the reducing fish populations in rivers, lakes, and along the coastline. Our members and customers want to recreate on clean water and want to fish in clean waters. The recreational boating industry is very dependent on clean water for continued strength and economic growth.

Because of our love of a clean water environment, we strongly support S. 1114. Our membership, however, is very concerned about the economic cost of uncontrolled

Page 2
Chairman
August 11, 1993

federal and state regulation in this regard. It is important to us that Congress and regulatory agencies understand our industry and what we can do, both financially and technologically, to comply with Congressional intent on clean water.

The recreational boating industry, which consists primarily of small, family owned and operated businesses, is very sensitive to economically achievable pollution prevention and clean up measures. We commend your leadership in this regard and agree with the intent of S. 1114 regarding the frequent references of "sound science and sound economics." Environmental regulations must be subject to cost versus benefit analysis. With strong Congressional interest to reduce the deficit and reduce government spending at the same time of increasing expenditures for environmental preservation, we believe Congress should establish priorities to clean the water. Secondary polluters, such as the boating industry, certainly need to be addressed, but emphasis should be on getting the biggest bang for our hard earned tax dollar.

S.1114 was sensitive to the difficulties state and local governments have in complying with prior versions of the Clean Water Act. We ask that the committee also recognize the difficulties small businesses may have in complying with the current rewrite. In particular, our members need to understand just what it is they need to do to comply with the Clean Water Act and subsequent regulations.

MRAA has been a participant with environmental organizations, boating consumer groups, Sea Grant colleges, State and Federal Agencies, and other boating industry groups in an effort to educate small businesses in our industry and therefore we cosponsor the CleanMarina program. This is a non-governmental initiative proposed to reduce incremental pollutant levels from the boating industry and recreational boaters. We believe this program is a proactive program by a consortium of many groups which play an important role in developing the technical information so badly needed and the education programs to accelerate the accomplishment of the Clean Water Act. It is important to note that this program is an educational program only and all capital improvements made to boating facilities will be paid for by the industry. We ask that the rewrite of S. 1114 contain language authorizing this program for the Environmental Protection Agency to administer.

Again, we thank you for your leadership in reauthorizing the Clean Water Act and ask that you or your staff contact us for assistance, if needed.

Best Regards,

Jerry Larsen
President

**MWD**

METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

August 31, 1993

Office of the General Manager

Honorable Bob Graham
Chairman
Subcommittee on Clean Water, Fisheries and Wildlife
Senate Environment and Public Works Committee
456 Dirksen Senate Office Building
Washington, D.C. 20510

Dear Senator Graham:

Submittal of Clean Water Act Testimony

The Metropolitan Water District of Southern California (Metropolitan) is very interested in the reauthorization of the Clean Water Act (CWA), and we have prepared a CWA position statement which addresses issues of concern to public drinking water suppliers. The purpose of this letter is to submit to you Metropolitan's position and recommended CWA amendments for the reauthorization of the CWA, and to request that they be incorporated into the CWA reauthorization hearing record for the Subcommittee on Clean Water, Fisheries and Wildlife, Senate Committee on Environment and Public Works.

Metropolitan is a special district created by the California State Legislature in 1928 to provide supplemental water for cities and communities on the coastal plain of Southern California. Metropolitan's service area includes in excess of 160 cities and has a combined population of over 15 million. To provide this service, Metropolitan operates an extensive system of drinking water conveyances, reservoirs, and water treatment plants.

Metropolitan's traditional supplies are currently obtained from the Colorado River through the Colorado River Aqueduct and from Northern California through the State Water Project's 444-mile-long California Aqueduct. Metropolitan also has worked with its member agencies for years to develop other sources of supply through reclamation of wastewater, clean-up of contaminated groundwater, conservation of agricultural water, and desalination of brackish water and seawater.

As a prelude, your Subcommittee should be aware of the dramatic increase in regulatory activity in recent years directed at the Nation's drinking water providers. Under the Safe Drinking Water Act (SDWA) Amendments of 1986, drinking water purveyors have witnessed the number of regulated contaminants

Honorable Bob Graham

-2-

August 31, 1993

increase from about 20 to over 80 contaminants which are currently regulated. Regulations for microbiological contaminants, filtration and disinfection of surface water, disinfection of groundwater, disinfection by-products, radionuclides, and a large number of organic and inorganic contaminants are in development or have been proposed or promulgated. In addition, treatment requirements constrain our operational flexibility to the point where it is no longer possible to tolerate the continued degradation of our basic sources of supply. **Preventing contamination of source waters must be stressed.** We believe the opportunity is now at hand to provide the mechanism by which policy makers can ultimately weigh pollution prevention costs against the costs of the traditional "end-of-pipe" treatment approach now in place in our Nation's water utilities.

The following CWA position statement focuses on significant drinking water quality problems which exist in the Nation's surface water bodies, and on suggested amendments to the CWA which address these drinking water concerns. The three major issues of concern to Metropolitan are:

1. The need for increased source protection for public drinking water supplies;
2. The need for representative monitoring of point source and agricultural discharges to surface water drinking water supplies; and
3. The need to facilitate the reuse of wastewater.

I would like to first provide you with background on these issues and then summarize our suggested CWA amendment language to deal with these problems. The attached draft provides suggested CWA amendment language that Metropolitan has developed concerning the reauthorization.

Statement of the Problem

Despite significant progress in water pollution control over the past twenty years, serious water quality problems persist, especially in surface waters which provide drinking water for 65% of the Nation's population. According to the U. S. Environmental Protection Agency's (USEPA) 1990 Water Quality Inventory Report, 56% of assessed lake acres and 37% of assessed river miles are threatened by sources of water pollution or do not meet water quality standards to support designated uses. The leading causes of impairment for rivers and lakes include nutrients, organic enrichment, metals, pathogens, and suspended solids. Agriculture was reported to be the leading source of pollution in both rivers and lakes. Clearly, point and nonpoint

Honorable Bob Graham

-3-

August 31, 1993

sources of water pollution impact the quality of surface waters which serve as direct sources of drinking water; however, the extent of these impacts is not well understood.

Drinking water regulations such as the USEPA's Surface Water Treatment Rule are prompting water utilities to become increasingly concerned about pathogen levels in source waters. In addition, published results from recent pathogen monitoring studies show that higher pathogenic organism densities are found in drinking water source waters receiving industrial or sewage effluents. These results indicate a risk to drinking water supplies.

The extent of the impact of combined sewer overflows or even secondary treated wastewater on downstream water suppliers is largely unknown. Wastewater treatment plants are currently required to monitor for fecal coliforms in their discharges to provide some measure of the sanitary quality of the discharge. However, this measure is clearly inadequate because there is no relationship between the absence of fecal coliforms and the absence of pathogens of drinking water concern (e.g., Giardia, Cryptosporidium). This encourages a false sense of security on the part of all. Data from the literature suggest that secondary treated wastewater effluent may contain from approximately 6,000 to over 100,000 cysts of Giardia per liter. Secondary treated wastewater is commonly discharged to the Nation's surface waters, yet no one is monitoring its affect on drinking water supplies. The science is clear and so should be the policy. Such pathogen contaminated discharges from either wastewater treatment plants or livestock operations could quite easily overwhelm a water treatment plant. The result will be outbreaks of waterborne disease.

The recent Cryptosporidium outbreak in the drinking water supply in Milwaukee, in which thousands of people became ill, clearly illustrates the importance of this issue. Although the source of the Cryptosporidium outbreak remains unknown at this time, this incident illustrates the need for increased monitoring of drinking water contaminants in potential point and nonpoint source discharges to surface waters serving as public water supplies.

The Milwaukee incident is not unique. Other significant Cryptosporidium outbreaks have been reported during the past decade in Carrollton, Georgia and Medford, Oregon. Furthermore, the Centers for Disease Control (CDC) reported 525 microbial disease outbreaks related to public water supplies from 1972 to 1988, affecting over 131,000 people. The CDC estimates that the actual number of water-borne disease outbreaks is much

Honorable Bob Graham

-4-

August 31, 1993

greater than that reported. Despite the documented occurrence of water-borne disease outbreaks, the fact remains that very little has been done to understand where water-borne pathogens come from and whether source control makes more sense than retrofitting the Nation's drinking water treatment plants with sophisticated and expensive technology.

An additional water quality concern for drinking water suppliers is the impact of agricultural discharges on surface water drinking water supplies. Return flows from irrigated agriculture and surface runoff from fields and cattle feedlots can contribute pesticides, nutrients, inorganic contaminants, pathogens, and suspended solids to the receiving water body. The results of recent surface water monitoring studies in the Midwestern United States have indicated widespread contamination of streams and rivers with commonly used herbicides, and in some cases the herbicide levels exceed drinking water standards. The Missouri River Public Water Supplies Association conducted an intensive monitoring study of the occurrence of pesticides in the Missouri River during May through July 1991. The herbicide atrazine was detected in 75% of all the samples, and in 32% of the samples atrazine occurred at concentrations exceeding the drinking water standard.

In California, agricultural drainage is a major concern for public water suppliers whose source of supply is the Sacramento/San Joaquin River Delta (Delta). Agricultural drainage from high organic content soils in the Delta contributes about half of the total organic carbon which occurs in the Delta. This organic matter serves as precursor material for the formation of disinfection by-products in treated drinking water. These agricultural discharges are currently dismissed as a drinking water treatment problem.

Metropolitan's source water supplies experience similar vulnerability to contamination from point and nonpoint sources of drinking water pollutants as those water bodies discussed in the previous examples. As a result, the drinking water quality issues presented are of concern to us and our member agencies in Southern California.

Public water suppliers must comply with drinking water standards for a large number of contaminants; however, drinking water quality problems cannot always be taken care of at the drinking water treatment plant with the installation of more advanced treatment technology. The reasons for this are as follows:

1. No drinking water treatment technology is mistake proof;

Honorable Bob Graham

-5-

August 31, 1993

2. Some advanced treatment technologies have adverse environmental consequences associated with their use;
3. For many waters, advanced treatment technologies are not cost-effective for removing the contaminants; and
4. Removing small amounts of contaminants from large amounts of water can be more costly than removing large amounts of contaminants from relatively small amounts of water.

Additionally, dischargers of the drinking water contaminants discussed above currently bear no responsibility for the public health effects of their discharge.

Amending the CWA to Protect Drinking Water Sources

Metropolitan believes the CWA should protect drinking water quality at the source. We believe that the Congressional Declaration of Goals and Policy of the CWA should be amended to specifically include protection of public drinking water supplies as a goal of the Act. The CWA must provide the same status for human health needs, through drinking water supply protection, as it does for protection and propagation of fish, shellfish, and wildlife, and recreation in and on the water. The CWA needs to send a strong signal to the States that drinking water quality is important.

Public drinking water supplies require clear and separate protection under the CWA since there are source water quality concerns specific to drinking water, and due to the need for drinking water purveyors to comply with increasingly stringent Federal drinking water regulations and to provide water that is safe to drink. While some drinking water regulations adopted under the SDWA emphasize source water protection, there is no clear statutory authority to implement this goal.

Monitoring Drinking Water Contaminants in Point-Source and Agricultural Discharges

Current point source monitoring requirements in the CWA are not specific enough with respect to public drinking water supplies. Metropolitan believes that additional monitoring requirements for unregulated pollutants of human health concern are necessary in order to better understand the sources of drinking water contaminants and the impact of point source discharges on drinking water quality. We recommend that the CWA be amended to require the USEPA to develop regulations that require monitoring of such discharges where there is a reasonable basis to believe the discharge is a source of a contaminant impacting a downstream drinking water supplier. The purpose of the additional monitoring requirements is to develop a better

Honorable Bob Graham

-6-

August 31, 1993

understanding of the source of specific water pollutants, and to develop a data base on which to base future reasonable regulatory efforts.

Agricultural discharges have been exempt from CWA discharge and monitoring requirements that are part of the NPDES program, and yet we know agricultural discharges directly impact the quality of surface waters designated as public drinking water supplies.

Metropolitan recommends that the CWA be amended to establish a state implemented monitoring program for agricultural discharges. A program for agricultural runoff and return flows should require representative monitoring of such discharges where there is a reasonable basis to believe the discharge is a source of a specific contaminant impacting a downstream drinking water supplier. Such a monitoring program is necessary to identify pollutants contributed by agricultural discharges, and to assess the impact of these discharges on public drinking water supplies. With the information provided by monitoring programs, appropriate best management practices can be developed to minimize, to the maximum extent feasible, the discharge of pollutants determined to impact public water supply source waters. Furthermore, monitoring data will establish a baseline from which to evaluate the success of agricultural nonpoint source pollution control programs.

Beneficial Use of Reclaimed Water

Another issue of great interest to Metropolitan and other public water suppliers in arid regions of the western U.S. is the use of reclaimed wastewater for ground water recharge, agricultural irrigation, landscape irrigation, and various industrial and commercial uses. In Southern California, the benefits of wastewater reclamation include a reduced need for imported water supplies, and a drought-resistant water supply for those situations where reclaimed water can be used.

The use of natural channels of ephemeral or intermittent streams is often necessary to transport reclaimed water to its area of use. Rigid application of strict USEPA water quality criteria for discharges of reclaimed water to ephemeral streams or effluent-dominated water bodies is inappropriate in arid regions and discourages wastewater reuse. The development of site-specific water quality standards where reclaimed water is discharged into effluent-dominated water

Honorable Bob Graham

-7-

August 31, 1993

streams, the requisite treatment may be technically difficult and prohibitively expensive. This could preclude the discharge of reclaimed water in the stream entirely in favor of ocean discharge, causing a reduction in streamflows for environmental uses as well as a waste of the resource.

In order to maximize the beneficial use of reclaimed water, Metropolitan recommends that the CWA be amended to:

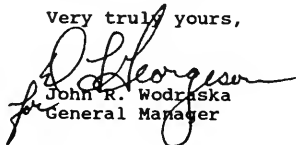

1. Adopt a policy statement allowing states to encourage the beneficial use of reclaimed water as a component of managing water resources and regulating water quality; and
2. Authorize the states to adopt site-specific water quality standards that facilitate the use of reclaimed water in arid regions of the U.S. and the discharge of reclaimed water to effluent-dominated and/or ephemeral streams.

Metropolitan believes that these amendments to the CWA are necessary to facilitate the development of water reclamation projects in our Southern California service area and throughout the western U.S.

Conclusion

The interrelationships of surface water quality protections and drinking water needs are critical to the Nation's public water suppliers, and Metropolitan will continue to focus efforts on these types of CWA issues. Should additional CWA hearings be scheduled by your subcommittee, Metropolitan would be pleased to testify on source water protection issues and other issues of interest to the Subcommittee. If you have any questions or require additional information regarding Metropolitan's views on the reauthorization of the CWA, please contact Mr. Edward Means, Director of Resources, at (213) 217-6412.

Very truly yours,

John R. Wodraska
General Manager

STATEMENT

OF THE

NATIONAL ASSOCIATION OF HOME BUILDERS

PREPARED FOR THE

**SENATE ENVIRONMENT AND PUBLIC WORKS COMMITTEE
CLEAN WATER, FISHERIES AND WILDLIFE SUBCOMMITTEE**

REAUTHORIZATION OF THE CLEAN WATER ACT

SEPTEMBER 29, 1993

REAUTHORIZATION OF THE CLEAN WATER ACT

This statement is filed on behalf of the 165,000 members of the National Association of Home Builders (NAHB) in response to the ongoing Clean Water Act Reauthorization efforts, as well as the President's plan, "Protecting America's Wetlands: A Fair, Flexible and Effective Approach," and the recently introduced Senate Bill S. 1304, the "Wetlands Conservation and Regulatory Improvements Act."

The President's Federal Wetlands Policy has been touted as fair and balanced, when, in fact, it does not address the fundamental problems and questions associated with the regulation of wetlands. Similarly, while Senate Bill S. 1304 appears to be an effort to provide a compromise between the Edwards Bill (H.R. 350) and the Hayes Bill (H.R. 1330) and many have called it a good starting point for discussion, the bill does not address many of the fundamental problems with the Section 404 program.

This testimony will focus on the basic deficiencies of current wetlands policy, the shortcomings of both the President's wetlands plan and Senate bill S. 1304, and the mandatory provisions that NAHB feels must be addressed within the legislative reform.

THE NATIONAL ASSOCIATION OF HOME BUILDERS

NAHB and its' 800 state and local affiliate builder associations have been heavily involved for many years in clean water policy debates at the federal, state and local levels. Many of our members have been leaders in wetland restoration and preservation projects, stormwater discharge control and management, and pollution prevention for land development across the country.

NAHB is made up of small business people, with over half of our members building fewer than 10 homes per year and close to 75 percent of our members building 25 or fewer homes. These are truly small business people. However, collectively, home building plays a significant role in our nation's economy. The investment in fixed residential structures, in real dollars, is equal to 4.3 percent of our nation's GDP. When you include spending on new residential appliances, carpets and home furnishings, the gross housing output is greater than 7 percent of GDP.

From the outset, let it be very clear that NAHB recognizes the importance and value of our nation's wetlands, and, we want to protect wetlands and our environment. However, the current system for protecting wetlands does not work. It lacks balance between needed protection of wetlands and the environment, the need for economic development and jobs in our local communities, and the protection of private property rights. Furthermore, the current system is a bureaucratic nightmare full of overlapping jurisdictions, costly delays, burdensome confusion and inefficient regulations. Although both the White House Policy and S. 1304 promise

to put an end to these inefficiencies, in fact, they will only serve to perpetuate the status quo.

MAKING THE CURRENT SYSTEM WORK

To address the failures of the current program, shift away from the status quo, and balance the needs of wetland protection and economic development in our local communities, NAHB recommends Congress adopt a comprehensive wetland reform package that would:

- 1) Establish a Congressional definition of a Federal jurisdictional wetland for purposes of Federal regulatory protection under the Clean Water Act and exclude from regulation all land areas which fail to meet a strict three parameter definition of wetlands.
- 2) Focus wetland protection on our nation's most valuable wetlands by classifying all wetlands into three categories and providing regulatory protection accordingly.
- 3) Streamline the current regulatory program by transferring all wetland permit authority to a single federal agency, improving efforts for state assumption of the permit program, establishing enforceable deadlines for permit decisions, implementing an administrative appeals program, instituting a wetland mapping program and requiring that all program regulations and guidelines be subject to public notice and comment.
- 4) Develop an effective wetland mitigation banking system to help achieve the goal of no-overall-net loss of wetlands and, ultimately, to help increase the nation's wetlands resources.
- 5) Protect private property rights by providing for compensation for the landowner who loses the economic viability of his property, as is guaranteed under the Fifth Amendment of the Constitution.
- 6) Streamline government, thereby adhering to the principles outlined for "reinventing government" announced by President Clinton and Vice President Gore.

LEGISLATIVE ACTION IS NEEDED...NOW

NAHB believes the time to implement the above suggestions is now! The Final Report of the National Wetlands Policy Forum, highlighted the needed call to action by saying, the "current regulatory and nonregulatory programs leave much to be desired...in short, current programs are too cumbersome and the responsibilities too diffuse to guarantee anyone -- landowners, the regulated community, conservationists, or even the regulators themselves, consistency, predictability,

timeliness, or effectiveness. It is a system that allows hundreds of thousands of wetland acres to continue to be lost or degraded annually, almost unnoticed, while substantial resources and time often are devoted to determining the fate of a few relatively small acres." As remarkable as it may sound, these remarks were made in 1988 and remain as relevant today as they were then.

CONGRESS NEEDS TO ESTABLISH WETLAND POLICY

NAHB believes Congress needs to reassert itself into this process by establishing the public policy for the protection of our nation's wetland resources. Congress has neglected this responsibility and has left the regulation of wetlands in the hands of judges, administrators and regulators. Indeed, Congress has never passed a piece of wetlands legislation. The program has grown on its own under the authority of the federal government to regulate dredge and fill activities in navigable waters. This has got to end. Only Congress can stop wetland losses by bringing under the regulatory umbrella activities that are destructive to wetlands such as draining, channelization and excavation. Only Congress can end the bureaucratic nightmare of overlapping permit jurisdiction and vetoes by establishing a single permit agency. Only Congress can establish fairness to the permit program by granting applicants appeal rights and reasonable deadlines. Only Congress can put an end to the regulatory gridlock and establish a balanced program.

PUTTING "WET" BACK IN WETLANDS

NAHB believes that a balanced program for wetlands protection requires comprehensive legislative reform of Section 404. The first component of a legislative reform package should be a clear Congressional definition of wetlands.

By defining wetlands, we are not asking Congress to consider every specific criteria for hydrophytic vegetation, hydric soils and wetland hydrology. However, we do believe it is responsible, even necessary, for Congress to establish the definition of what types of lands should be jurisdictional for purposes of the Clean Water Act. In this regard, the Congress needs to establish how wet a wetland should be.

Many argue that the determination of what is considered a jurisdictional wetland is not a policy decision. Contrary to that belief, NAHB asserts that the definition of a wetland cannot be legitimized except by Congress. Recently, Congress reaffirmed its policy decision to exempt prior converted croplands from the federal wetlands regulatory process. This willingness to make policy decisions should be further carried out with a decision regarding the definition of wetlands.

In 1972, when Congress first passed the Federal Water Pollution Control Act, now known as the Clean Water Act, the word "wetland" did not appear because the

regulation of wetlands was not even considered. Congress defined jurisdictional waters as "waters of the United States." Following lawsuits defining what constituted navigable waters, in 1977 the House of Representatives proposed to restrain the reach of Section 404 jurisdiction to navigable waters and adjacent wetlands, with specific definitions of each term (See Section 16 of HR 3199, as reported). The Senate, however, favored delegation of dredge and fill activities to the states without a specific wetland definition. It was thought that by delegating the Section 404 program to the States, each state could protect its wetlands as it deemed appropriate, within guidelines set by the U.S. Army Corps of Engineers (The Corps). The 1977 amendments established that Congress did not intend to use a narrow "navigability" definition but rather something broader. Congress passed the Clean Water Act reauthorization in 1977 without a clear definition of "waters of the United States," no legislative definition of jurisdictional "wetlands," and no explicit authorization to regulate the protection of wetlands.

Congress first needs to establish explicit policy to regulate and protect wetlands. Following that it needs to establish a national policy that defines what types of land should be delineated as jurisdictional under the federal wetlands program. S. 1304 seeks to tackle this problem by codifying the definition of wetlands that has been in use by both EPA and the Corps since 1977. The definition reads,

"those areas that are inundated or saturated by surface water or groundwater at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, fens, potholes, playa lakes, vernal pools and similar areas."

The inclusion of this definition within the legislation will do no more than to codify the unbalanced regulatory definition that has been in use for more than 15 years. Adoption of this definition will not resolve the debate over what wetlands are deemed jurisdictional under the Section 404 program. In addition, this definition does not specify a duration of saturation, require the presence of obligate wetland species, nor require on site verification of all three parameters. Ignoring these details will further perpetuate confusion and the reigning status quo. Indeed, under this definition, land without any standing water, at any time of the year can be considered wetlands, hence the regulation of millions of acres of "dry" wetlands.

Congress should require that wetlands should actually be wet and accordingly should have independent verification of all 3 wetland parameters (wetland hydrology, hydrophytic vegetation and hydric soils). Congress should also require surface water for 21 or more consecutive days during the growing season. These two changes

would return the regulatory program to regulating the type of land most of us call swamps, marshes and bogs.

NATIONAL ACADEMY OF SCIENCE STUDY

As Congress works to define the types of land subject to Federal jurisdiction under Section 404, it is appropriate to comment on the National Academy of Science (The Academy) study for which Congress appropriated funds in the 102nd Congress. The Academy's Committee on Wetlands Characterization is to produce a report that will review and evaluate the scientific bases of wetlands identification and characterization for management. The report is expected by September 30, 1994.

As we have stated, the Clean Water Act is silent on the definition of wetlands. It was not until the 1977 amendments that wetlands were even mentioned in the statute. In the 102nd Congress, a number of groups, including NAHB, urged Congress to establish in the law the policy criteria for the types of land that should be regulated under the scope of the Federal jurisdiction. Other groups urged Congress to avoid addressing this policy issue stating that further science was needed and they urged a study by the Academy.

The study was proposed, debated and defeated by the House of Representatives by a vote of 181-241. Many lawmakers believed that after 20 years of research and volumes of field data it was unlikely the Academy would discover any new science during a one year study. After all, the 1987 Manual was written after 10 years of research and field testing at a cost of over \$5 million. However, at the close of the session, such a study was included, without hearings or debate, in the Environmental Protection Agency (EPA) appropriations bill. The study was to be completed within one year of enactment and at a cost of \$400,000.

The issue of whether additional scientific or policy criteria are needed was addressed by the Supreme Court in the Avoyelles Sportsmen League v. Alexander case when the court stated, *"It is quite obvious from this history that the term 'waters of the United States' and 'wetlands' are not terms of pure science. They are not meant to be. 'Wetlands' is a jurisdictional term, the product of the legislative process... Thus the 'wetlands' definition does not answer a scientific need, it satisfies a practical, a social, a political need, the need to define the scope of Section 404 jurisdiction."*

For over twenty years scientists have collected data regarding what criteria should be used to determine if land is a "wetland". This has been difficult, however, since different criteria are used in different regions and resource areas. Moreover, different types of land are defined in Federal, state, and local statutes, and their definitions are inconsistent. Further, these laws generally do not define the scientific components necessary to identify specific lands but instead, establish the policy

criteria that justify the regulation of the land.

The accumulation of knowledge and scientific research on wetland delineation makes one fact inescapably clear: there is simply no body of information that will provide easy, certain answers to wetland delineation questions without Congressional action to define the type of land that should be regulated under the Section 404. The NAS study is fundamentally flawed since it has been done backwards. Congress should first make the decision regarding what areas should be deemed jurisdictional wetlands, then a study should be initiated by NAS to establish a manual that adheres to that definitional decision.

The determination of a definition of jurisdictional wetlands is a policy decision that must be legitimized by Congress, not scientists. Congress must decide what it wants to be the limits of federal regulatory jurisdiction.

SCOPE OF REGULATED ACTIVITIES

Section 404 of the Clean Water Act requires permits for the discharge of dredged or fill materials into navigable waters, which the statute defines as "waters of the United States." Following the adoption of a reasonable definition of wetlands, NAHB believes it is appropriate to expand the regulated activities of Section 404 in these areas within the framework of a comprehensive wetlands management plan.

Some believe that all activities undertaken within a wetland require a Section 404 permit. This is wrong. Many activities that are specifically harmful to wetlands are not regulated. A GAO study found that "many activities resulting in substantial wetland losses are not regulated by the Section 404 program." Section 404 regulates only the discharge into wetlands of dredged or fill materials from a point source. Activities associated with home construction generally are included.

The limited scope of the program stems from the fact that Congress intended the 1972 Clean Water Act be a pollution control program, not a wetland regulatory program. Furthermore, it is clear Congress did not mean to regulate activities in wetlands but rather the sources of pollution. In the legislative history of the Act, the Congressional Research Service wrote that Congress focused on the fact that the dredged soil resulting from the creation and maintenance of navigable waterways was often contaminated and concluded that the common practice of disposing of dredged spoil in other areas of the navigable waters ought to be regulated. The limited scope of the Clean Water Act Section 404 program is another reason why Congress should address this issue through reform.

While judicial decisions and law suits have attempted to increase the scope of the permit program, the clear statutory language and legislative history have restricted many such efforts. If our nation's remaining wetland resources are to be managed,

the Clean Water Act needs to be amended to include as regulated activities draining, channelization and excavation. This additional regulatory authority, however, must be balanced with meaningful streamlining measures so that agencies can handle their administrative responsibilities in an efficient and reasonable manner.

Senate bill S. 1304 provides such an expansion, as it redefines the discharge of dredged or fill material to mean,

"any addition of dredged or fill material into navigable waters and includes, without limitation, any addition or redeposit of dredged or fill materials, including excavated materials, into the navigable waters which is incidental to any activity, including draining, mechanized landclearing, ditching, channelization, or other excavation that has or would have the effect of destroying or degrading any area of navigable waters."

Unfortunately, this expansion is not coupled with any provisions to address the bureaucratic red tape and inefficiencies now inherent in the program. Accordingly, NAHB would strenuously oppose the expansion of the program in this manner.

In the same vein, the Administration has incorporated similar expansion through the illegal issuance of the Tulloch Rule as a portion of its wetlands reform package. Although not given the Congressional authority to do so, EPA and the Corps have usurped Congress' authority and published the final rule incorporating such expansion. NAHB believes this act to be so egregious that we have filed suit against the federal government seeking an immediate injunction over the implementation and enforcement of the Tulloch Rule.

Beyond the illegality of the action, however, the implications of this broadened definition are significant. Indeed, the activities it addresses would be irrebuttably presumed to result in the discharge of dredged material, and the discharge would be presumed to cause destruction or degradation of U.S. waters unless the project proponent can demonstrate otherwise. The burden of proof, therefore, is on the landowner to show that no destruction or degradation has taken place. However, it would be virtually impossible to do so as a proponent must evaluate not only the immediate impacts of the dredge or fill activity, but also any individual or cumulative impacts resulting from the entire project, even those activities occurring in non-wetland areas.

Furthermore, the rule goes on to define "destroy or degrade" as "an identifiable decrease in the functional values of the water of the United States." This criteria is unavoidable under virtually any circumstances, making the presumption of destruction on degradation nearly impossible to refute.

NAHB is not categorically opposed to the regulation of excavation and similar activities, in fact, we support it in the context of a more balanced approach. In this regard, NAHB supports passage of H.R. 1330, which would expand the scope of the program, but which also includes initiatives which streamline the process and make wetlands regulations more predictable. The expanded scope of activities must be part of a larger, comprehensive reform of Section 404, whereby the program will progress from solely a pollution control initiative into a wetland resource management act.

SINGLE AGENCY ADMINISTRATION

Congress must address the burdensome, confusing, and inefficient overlapping jurisdictions of the program by the Corps and the Environmental Protection Agency. If the Section 404 program is to be efficient and effective and reformed into a wetland resource management act, then the program must be given to a single Federal agency to administer. This will not only bring efficiency to the program and reduce costs and confusion to applicants, but will place total responsibility and accountability with a single agency. No longer will one administrator be able to point to another and claim that it wasn't their responsibility to promote wetland protection, research new restoration techniques or undertake aggressive mitigation banking to increase the nation's wetland resources.

The problems of bifurcated agency administration go back to the beginning of the program. The Section 404 permit program originated with the 1972 Clean Water Act as a program intended to control pollution from point source discharges of dredged or fill material. During the debate, Congress avoided the decision of who should be responsible for the program by granting the Corps of Engineers permit issuance authority and, the newly created EPA a significant parallel authority to set permit standards and the power to veto specific permits. No agency was charged with the responsibility to educate the public about the importance of wetlands, research efforts to reduce losses, develop proposals to restore these valuable resources, or establish mitigation banks.

As the program evolved, the Corps and EPA too often developed different interpretations of the Act's permitting requirements which resulted in confusion and chaos. Furthermore, the Corps, EPA, Fish and Wildlife Service and the Soil Conservation Service all established different delineation manuals. It became possible for a landowner to get a permit from one agency and, at the same time, be denied a permit by another agency. **No other Federal regulatory program gives more than one agency direct authority over the same permit program.**

Not only has this bifurcated administrative structure lead to interagency disputes and costly inefficiencies, the requirements of the two agencies are often conflicting, and the results are unpredictable. The task of unraveling the conflicting policies and requirements of the two agencies fall upon the property owner.

It is time for Congress to end this administrative gridlock of conflicting policies, lengthy permit review delays, unnecessary permit costs and confusion. With no one in charge, opportunities for public education, research and wetland advocacy are lost in the bureaucratic chaos.

NAHB believes the wetlands regulatory program would be greatly improved by Congress giving sole regulatory authority to a single Federal agency. In this regard, we urge Congress to vest not only the authority to regulate wetlands, but also the mission to protect this nation's wetland resources with the Army Corps of Engineers. To achieve such a goal, we support H.R. 1330, which would grant the Corps sole authority to administer the Section 404 program.

We support giving the Corps this mission because of their extensive network of District Offices and larger field staff, two essential components necessary to run a regulatory program involved in thousands of local permit actions each year. In addition, approximately 40 percent of the permits the Corps processes are for Section 404 and Rivers and Harbors Act Section 10 activities. Because Section 10 authority rests with the Corps it makes additional sense to give sole authority for Section 404 to the Corps.

In stark contrast to single agency administration, both S. 1304 and the White House Policy have taken the opposite track and attempt to expand the number of agencies involved in the Section 404 program. Specifically, S. 1304 allows virtually all federal agencies to get their hands in the permitting process, while the White House Policy advocates making the Soil Conservation Service responsible for all jurisdictional determinations made on agricultural lands. Although both plans seek to end the duplication and overlap of efforts, inconsistency and permitting delays caused by the current structure, the proposed revisions will only serve to exacerbate these problems. The status quo will be maintained.

WETLAND CLASSIFICATION BY FUNCTION AND VALUE

The current regulatory system treats all wetlands equally, even though different wetlands provide different functions and values. As currently constituted, pristine coastal wetlands and man-made drainage ditches are afforded equal protection under Section 404. Although the agencies have not yet agreed on a classification scheme for assessing the functions and values of wetlands, the permit program currently requires an evaluation of the environmental value by the District Engineer at the end of the process. More important, S. 1304 makes no attempt to address wetlands by function and value.

Classification should be the regulatory connection to wetland functions and values. Classification would serve to streamline the permitting process, preserve valuable resource areas and help to legitimize the 404 program by mandating

sensible, understandable and reasonable compliance standards. Classification would change the attention from delineation of hydrophytes and hydric soils, to actual protection of valuable wetlands.

This change in focus can only be achieved, however, if wetlands are considered a managed resource. Wetlands of exceptionally high functions and value to a watershed may merit a management strategy of avoidance. A significantly different watershed management strategy is appropriate for abundant and marginally functional wetlands. This approach focuses on the net-environmental benefit to water resources as opposed to no-net loss of wetland permitting. The fact that classification systems are difficult to establish and administer does not change the fundamental reality that, from an economic, as well as watershed and environmental protection points-of-view, it should be done.

We strongly urge Congress to authorize a classification system for Section 404 wetland resource management. This system will increase regulatory efficiency by providing a framework for decisions and actions. The classification system should occur during an advance identification effort or early in the permit process. This will allow the agencies to focus permit, personnel and enforcement allocations on more critical water resources. It will also reduce uncertainty and inspire new public support and compliance in the permit program.

We would urge the Committee to consider the classification system envisioned in H.R. 1330. H.R. 1330 would establish a three-tier classification scheme for wetlands based on their functions and values. Type A -- those with the highest values -- would be those determined to be critically significant to the long term conservation of the ecosystem in which they are located. Type B wetlands would be those which provide habitat for a significant population of avian aquatic or wetlands dependent wildlife, or provide other wetlands functions including significant enhancement or protection of water quality, or natural flood control. Type C would be those which serve limited wetlands functions and are of least significant environmental value.

Classification as envisioned in H.R. 1330 is a significant environmental benefit for wetland preservation. Under the existing regulatory system, all wetlands are treated as if equal and are given regulatory protection against the discharge of dredged or fill materials. However, under a tiered classification system it would be possible to provide a higher level of protection to those wetlands of the most significant value. Less time would be spent issuing permits for activities in wetlands of marginal value (Type C) and more time spent assuring that the functions and values of higher quality wetlands are protected. Thus, classification would maximize Federal efficiency by focusing attention on wetlands most valuable in protecting water quality.

PERMIT DELAYS

Improving the efficiency of the regulatory system through a classification system is desperately needed as the permitting demands have far exceeded the Federal agencies' resources. One Corps District Engineer wrote to the Corps Headquarters, "We are imposing severe time delays on the public and foreclosing development options on considerable tracts of land. It appears that we have lost our focus on what we are regulating and why we are regulating it."

Former EPA Administrator Reilly recognized this fact when he stated, "The second complaint most frequently encountered from owners of wetlands is, if a person is subject to wetlands permitting regulations, can they expect a decision in a reasonable time?" Indeed, on average it currently takes over a year for a final decision to be made. This is not acceptable.

To address this problem, deadlines for permit reviews must be included in wetland reform legislation. NAHB specifically supports the legislative language as drafted in H.R. 1330, which mandates permit review within 180 days from the date the application is filed. The proposed bill also includes a method by which the mandate will be enforced. Conversely, processing of permits under S. 1304 is designed to occur within 90 days of the date of public notice. Unfortunately, this deadline does not take into account the amount of time it takes for a permit to proceed to the public notice stage, nor the time for a jurisdictional determination to be made. In addition, this mandate is not enforceable as written. A provision should be included which states that if a permit decision is not reached within the 90 day timeframe, the permit is deemed granted.

Concern has been voiced over this "automatic" granting of permits after the deadline date has passed. The agency may, under the pressure of a deadline, make the decision to simply deny a greater number of permit applications than may otherwise occur under a less stringent time frame. This may be the case. However from the landowner's perspective, it is preferable to receive a decision in a swift manner, then make the decision to sue if one so chooses. The less palatable alternative would be to have to wait the average of 367 days to get a decision, then have to begin the appeals process. Expeditious permit processing is vital to the economic viability of a development project and can help to promote more affordable housing.

It should also be noted that the current regulation sets a goal of permit decisions within 60 days, and since S. 1304 provides for a number of exceptions to the 90 day deadline, permit processing could take as long as it does currently. Both S. 1304 and the White House Policy fundamentally ignore the procedural delays and uncertainty that already plague the permitting program.

Firm, enforceable deadlines must be established for both the 404 permit process and requests for jurisdictional determinations.

MAPPING WETLANDS

One of the greatest frustrations for many land owners is the discovery that land they have owned for many years, that appears dry, has suddenly been declared a wetland. It is equally as frustrating to home builders to learn after they acquire land that even though the land has no signs of water, it is considered a wetland.

In these situations the land is not a swamp, marsh or bog. It is usually land that is wet for only a short time each year, with no evidence of standing surface water. The adoption of a more responsible definition of a Federal jurisdictional wetland should eliminate many of these problems by delineating only "wet" wetlands. Regardless, it is time this country invest in efforts to map wetlands to help everyone know where such lands exist.

In most every town, parish or village in America, maps exist showing soil types, flood plains and elevations. Yet, if you were to consider purchasing a site for a new housing development there is no map to which you could refer to determine if the site is a wetland. What better tool to direct development and other regulated activities away from wetlands than mapping?

Many argue that mapping would be expensive. However, the costs of not having maps of wetlands is even greater. Without maps activities are going to accidentally occur in wetland areas. Landowners are collectively going to spend hundreds of millions of dollars on engineering and consulting fees reviewing and delineating wetlands. And, the Federal regulatory program will remain in the dark ages -- struggling to delineate one property at a time, each time an activity is proposed in an area that could potentially be a wetland.

NAHB supports a mapping provision included in H.R. 1330 which would require the identification and classification of wetlands within 10 years after enactment. The mapping project would involve notification to land owners to assure their participation in the mapping process. Preservationists would also benefit as the identification of wetlands would, to the fullest extent practicable, become part of property records in the county, parish or borough in which such wetlands are located, and can be used to identify sites for the establishment of parks or nature preserves. Consequently, S. 1304 contains no provisions for the mapping of wetlands.

As home builders, we carefully review town records and available maps. There is no better form of avoidance for a home builder than knowledge that a site contains a wetland. Mapping is an important tool which can serve to meet the goals of the federal wetlands policy. Mapping should be an integral part of comprehensive

wetlands legislation.

REPLACING THE ALTERNATIVE ANALYSIS

Under the current interpretation of the Section 404(b)(1) guidelines, the key standard in the permitting process is to avoid a regulated activity in a wetland. Permit applicants must provide evidence to convince the Corps that there are no practicable alternative sites available to the applicant and that the applicant has avoided impacts on site to the extent practicable. Unfortunately, neither the Corps nor EPA have issued regulations on how to conduct and document an alternative analysis. When builders attempt to show they have considered all the alternatives, they are often forced to resubmit their applications several times in response to hypothetical alternatives that EPA and the Corps want them to consider.

For example, EPA has said that home builders are accountable for having to evaluate all alternatives, including purchasing non-wetlands sites not owned by the applicant, at the time they "enter the market." Yet, EPA has not defined when an applicant enters the market. Is it when the home builder first sees a "For Sale" sign on a tract of land? Is it when the home builder first discusses the purchase price with the owner, or is it when he/she signs a purchase option agreement? Equal uncertainty exists over the required geographic scope of the search for alternatives. Is it the applicant's market region, or the political subdivision? Is an applicant expected to evaluate alternatives within some region broader than a political subdivision or county? As a result of this lack of guidance, applicants waste time and money responding to hypothetical and often unreasonable alternatives.

The alternative analysis is the single most confusing, time consuming, and problematic aspect of the current 404 regulatory program. Neither S. 1304 nor the White House Policy has proposed a legislative solution that effectively tackles this problem. It is time to take a serious look at alternative methods of assuring minimal effects to wetlands from development activities, as the alternative analysis is clearly not working.

On August 24, 1993, EPA and the Corps distributed a Regulatory Guidance letter pursuant to the White House Policy. This document was intended to clarify the flexibility inherent in the EPA's (b)(1) guidelines, however, it simply restated the policies and procedures already in use.

The best replacement for alternative analysis is useful maps identifying and classifying wetlands.

ADMINISTRATIVE APPEAL

As anyone who has applied for a Section 404 permit knows, the costly and burdensome regulatory permit process is a nightmare of individual decisions, upon decisions, upon decisions. First is the decision of whether the land in question is a wetland -- is the land wet, for what duration, what indicators should be used to relate surface water, should secondary indicators be used, can aerial photographs satisfy the hydrology criterion, or should the squeeze and shake test confirm surface saturation? Then the questions regarding vegetation, soils and exceptions to the Delineation Manual must be answered. Once the land is delineated as a wetland the applicant faces the 404(b)(1) guidelines which involve questions about practicable alternatives for the projects. Finally, the questions must be answered of whether the project will cause or contribute significantly to the degradation of the wetland; whether appropriate and practicable steps have been taken to minimize potential adverse impacts and whether mitigation is appropriate and/or required.

The permitting process involves hundreds of decisions and each and every decision impacts the cost and design of the project. Often these decisions are reached through consultation and cooperation. However, even with small, relatively simple projects, disagreements arise. Some times these disagreements can be resolved. Other times, the applicant is left with few options -- withdraw their application; modify the project and reapply; or, if, and only if the application has been formally acted upon, you have the right to bring suit against the Corps or EPA. At no time does Section 404 provide an applicant the right to an administrative appeal.

Furthermore, the Clean Water Act precludes pre-enforcement judicial review. Applicants are only provided the right to sue the Corps or EPA if their application has been formally acted upon. Consider this possibility: A land owner attempts to build a garage or addition on to an existing home. The Corps claims the land is subject to jurisdiction under Section 404 of the Clean Water Act and requires the home owner to obtain a permit. The applicant wants to challenge this claim. However, because there is no administrative appeal process and the law precludes judicial review unless final permit action has been taken, the applicant must apply for and go through the entire process, in order to appeal the government's claim that their land is actually a wetland. For an application to achieve final permit action, the landowner must submit a request for a permit, agree that the in question is a wetland, complete the 404(b)(1) guidelines and consider mitigation proposal. Only after completing the entire process can the applicant seek judicial review to determine if the land is actually a wetland.

On the other hand, however, if the Corps determines that a property is not a jurisdictional wetland under section 404, a third party may challenge that determination through judicial review. It is inequitable for property owners to have less rights than citizens' groups for challenging jurisdictional determinations - especially on their own property! The appeals process, while intended to protect the

applicant, inadvertently exposes applicants to the scrutiny of preservationist groups, or neighbors, or virtually anyone who might have an interest seeing a project halted.

The outcome of the jurisdictional determination ultimately determines if one must deal with the Section 404 permitting program. The implications resulting from this threshold decision mandate jurisdictional determinations to be made in a fair and efficient manner. Whereas no other federal regulatory program has a comparable dispute over jurisdiction, NAHB believes that the areas regulated under the Section 404 program must be predictable.

The realization of this flaw within the existing regulation is apparent, as provisions for administrative appeals of permit decisions appear in both the President's wetlands policy and S. 1304. Whereas S. 1304 provides for the establishment of rules under which decisions may be appealed, the provision only applies to final permit decisions. In addition, the bill lacks specific criteria under which an appeal may be heard and by whom an appeal may be brought.

The White House Policy is preferable in that it broadens the applicability of the appeals process to include not only permit denials, but also jurisdictional determinations and administrative penalties. There is concern, however, in that none of the details of such a plan have been provided.

The Clean Water Act must allow an affected property owner to obtain judicial review of an enforcement matter or to question a jurisdictional determination before final permit action occurs. Furthermore, the citizen suit provision must be amended so that it is available only for those with site specific interests. Current processes are not only time consuming for everyone, costly to the applicant and the government, and inefficient for all parties, they are wrong!

We strongly urge the Congress to correct this inefficient, inappropriate process by adopting an administrative appeals procedure.

COMPENSATION FOR TAKING

The Fifth Amendment to the United States Constitution prohibits the government from "taking" private property for public use without just compensation. In the context of the regulatory arena, the Supreme Court has found a taking where a regulation deprives a property owner of all economically viable uses of his land and where the regulation was not substantially related to a legitimate public interest. In July 1990, the United States Claims Court issued two rulings that denial of Section 404 permits resulted in takings for which the property owners must be compensated. In *Loveladies Harbor, Inc. v. U.S., No. 243-83C [Cl. Ct. July 23, 1990]*, the court awarded over \$2.7 million in damages, plus interest and attorney fees. In *Florida Rock Industries v. U.S., No. 266-82C [Cl. Ct. July 23, 1990]*, the court awarded the

plaintiff \$1 million. These appear to be just the beginning of legal taking challenges.

The issue of "taking" is central to the question of wetland regulation since more than 75 percent of all wetlands are located on private property. Individuals have a right to expect that if the government is going to severely restrict or prohibit development opportunities, and thus reduce economic value of their land, they will be compensated for the fair market value of the land.

Some claim this is an unreasonable request because of the government's current budget deficit. However, can a price be placed on the principles upon which this country was founded? The Administration "strongly supports private property rights," but its stance on the issue of compensation advocates the continuation of the status quo. Currently, the courts are clogged with suits regarding the regulation of private property. This system is extremely costly and allows only the wealthy to question an action or to protect their private property rights. NAHB strongly believes that if private land owners have their land "taken" from them through Federal regulatory action, they deserve compensation. The benefits of the government's regulation of wetlands are benefits that all citizens enjoy and the costs of such benefits should be equally shared by all Americans.

Additional arguments are raised proclaiming compensation should not be required because land owners can always take an issue to court. The decision to provide for compensation, however, is a policy matter, not a procedural one. Private land owners whose property is regulated to the point of suffering a substantial diminution of value, should be compensated.

NAHB does not believe that all land owners of jurisdictional wetlands should be compensated for their property. Assuming a reasonable wetland permitting program, compensation should only be granted when the economic value of the land has been severely restricted due to the denial of a wetland permit. These are normally areas where the public protection of such wetlands is believed to be greater than the benefits of the proposed project.

H.R. 1330 achieves this goal by allowing property owners whose land has been designated as containing the highest quality wetlands to apply for compensation within two years of their designation as Class A wetlands. Compensation would be provided at fair market value. NAHB supports this provision.

Finally, it is important to note that regardless of whether a private land owner is able to prove a successful takings claim against the Federal government the regulatory program is not without costs to the general public. When new schools, hospitals, residential neighborhoods or economic development projects are stopped because of Section 404, jobs are lost, growth is restricted, school and local property

tax bases are reduced, and the value of local private property is diminished or totally lost. Although no funds are expended from the Federal government treasury, many different people pay the price.

This is not to suggest that all proposed activities in wetlands should be approved. Instead, we believe the Federal government must recognize that wetland protection has a price. If private lands are to be taken through the Section 404 regulatory program, private land owners should be compensated. Unreasonable demands should not restrict responsible activities in and around wetlands. There is room for wetland protection and economic development to responsibly exist together.

Congress must rethink the impact of wetlands regulations on private property and decide who should ultimately pay the price. Failure to act will only serve to sustain the static nature of today's regulatory scheme. S. 1304 fails to address the subject of compensation, thus will serve to perpetuate the fragmented wetlands policy.

MITIGATION

Although Section 404(b)(1) guidelines and the Corps regulations have general sections on mitigation, the most far reaching policy on mitigation was adopted -- without the public notice and comment required of a rulemaking -- in a Memorandum of Agreement (MOA). In the MOA, the agencies adopted a strict sequence for making wetland decisions: avoidance, minimization, and compensation. Once an applicant proves that he/she has no alternative to the activities for which they seek a permit they must minimize the amount of wetlands to be disturbed and compensate for any damage by mitigating the impacts of any unavoidable activities.

This process, starting with avoidance and allowing compensatory mitigation only as a last resort, is inefficient and in some cases, counter-productive from an environmental standpoint. This "policy" forces permit applicants to focus all their efforts and most of their resources on documenting why they cannot avoid the wetland. This may involve developing several different site development plans with varying levels of wetlands disturbance and a breakdown of the cost impacts of each development plan. This analysis typically results in a Corps' decision that the wetlands cannot be avoided completely. However, to get to this point the applicant must spend considerable time and large sums of money preparing worthless, multiple site plans or searching for alternative sites even though the property may have been purchased years before the development is planned.

The sequencing requirement can also lead to less than optimum permit decisions with respect to the environment. By divorcing the evaluation of the applicant's mitigation proposal from the evaluation of alternatives to activities in a wetland, applicants are precluded from presenting a comprehensive picture of the net

environmental impact of their project. Suppose a developer proposes to build a subdivision on parcel A, completion of which will impact 5 acres of easily mitigated wetland. While progressing through the sequencing requirement, the developer locates Area B, which will similarly serve his needs, but will only impact 4 acres of wetland. The wetlands impacted at site B, however, have values and functions that are difficult to mitigate. The inability of the developer to look at mitigation requirements in the midst of the sequencing mandate will lead him to gain approval for the development at site B even though the chances of mitigation success are much higher than at parcel A.

Because there is no formal, comprehensive Federal policy on mitigation, particularly on the role of compensatory mitigation in the Section 404 program, mitigation gets decided on an ad hoc basis. As a result, applicants again, waste time and money arguing over mitigation requirements. The current case-by-case, site-by-site approach to mitigation also leads to a series of small, unrelated mitigation projects scattered throughout a region. They are often too small and disjointed to maximize wetland benefits, and they sometimes suffer from inadequate monitoring and maintenance.

If this nation is to achieve the goal of no overall net loss of wetlands, or to reach beyond this goal to increasing the nation's wetland base we must address mitigation efforts. This Committee needs to provide the leadership for developing an appropriate mitigation policy that will return this nation to a course of wetland restoration.

NAHB supports the mitigation policy included in H.R. 1330 which recognizes that for mitigation efforts to be successful all interest must work together. Furthermore, we believe mitigation banking is an essential component of any successful mitigation policy.

MITIGATION BANKING

If mitigating the harmful effects of necessary development activities on the nation's waters is, indeed, a central premise of the Federal wetland regulatory programs, the programs must embrace mitigation banking.

The concept of a wetlands mitigation bank, similar to an ordinary bank account, allows the bank owner to create, restore, enhance or preserve wetlands in advance of the anticipated need for mitigation required under Section 404. The wetlands values created, restored, enhanced, or preserved in the bank would be quantified, and the bank owner would be able to sell these mitigation credits to Section 404 permit applicants. Withdrawals from the bank can be made as long as mitigation credits are available.

The idea of mitigation banking is not new. In fact, the Fish and Wildlife Service has used mitigation banking since the early 1980s to off-set the environmental impacts associated with development projects. However, mitigation banking has not been fully incorporated into the Section 404 program because of the lack of Congressional leadership and EPA's concerns over the scientific uncertainty of wetland creation. If a builder creates a 10 acre lake which is stocked with fish, visited by migratory birds and other wildlife, why is it valid for some preservationists and scientists to say this isn't a wetland, when the same individuals maintain that some dry land is valuable wetland. NAHB believes that regardless of whether wetlands can be created there is significant opportunity for wetland restoration, enhancement and preservation efforts.

Mitigation banking offers numerous advantages that will increase our wetlands base and improve the values and functions of those wetlands. The chance that wetlands mitigation will succeed is increased by mitigation banking since mitigation must be provided in advance of the loss. Banks consolidate many small isolated mitigation projects into one larger parcel, thereby creating an area that is "more environmentally valuable area that is more efficient and more economical to develop and manage than several scattered sites." [FWS Mitigation Banking, July 1988, p. 2]. Mitigation banking provides an economic incentive for the bank to make the project succeed. In addition, mitigation banks can be strategically located within the local landscape to satisfy the wetlands needs of the affected region and, unlike on-site mitigation projects, bank sites can be selected on the basis of the likelihood of wetlands mitigation efforts actually being successful.

Whereas the President supports the use of mitigation banking in appropriate circumstances, the provisions included in the "compromise bill" largely stymie the use of mitigation banks. The discretion given the agencies in that proposal, coupled with federal oversight and lack of incentives limits the establishment and use of such banks. In order for mitigation banking to be embraced and workable, flexibility and discretion must be maintained. In addition, the mechanisms available for mitigation banking should include not only restoration, but also creation, enhancement, and in some cases preservation, as stated in the President's plan. Neither S. 1304 nor the President's plan will fully serve the needs of the development community.

Based on the necessity for these components, as well as a degree of certainty, NAHB supports the mitigation banking provisions provided in H.R. 1330. The mandates in the bill would require the Corps to establish mitigation banks in each state for purposes of compensating the loss and degradation of wetlands functions and values under Section 404. The development of these banks would be coordinated with the Fish and Wildlife Service and the Governor of each state, while private banks would also be encouraged.

STATE PERMIT PROGRAM ASSUMPTION

Although Section 404 of the Clean Water Act provides a mechanism for states to apply and assume the Section 404 permit program, NAHB urges the Committee to take actions to encourage that state assumption. Since wetland characteristics and functions vary from region to region and water resources deviate from watershed to watershed, everyone seems to agree the regulatory permit program should be administered by the states. State assumption could deliver permits faster, offer one stop for state and Federal permits, provide more intimate knowledge of the resource, project and local land use planning, and administer greater long-term oversight. These merits save time, money and confusion. Despite the merits and the broad agreement on assumption, Michigan is the only state that has assumed the program and it recently warned in testimony before the Senate, that it may withdraw because the Federal program has become unworkable.

This breakdown in state assumption is particularly disappointing when one considers that while the Federal government is focused on regulatory gridlock the states have lead in wetland planning, restoration and management. All coastal states provide wetland regulatory protection and management, and 18 inland states have adopted freshwater wetland regulatory statutes. In addition, an estimated 5,000 local governments have adopted wetland protection regulations. Many additional state and local governments are poised to take on larger wetland management roles, particularly if encouraged and provided incentives to do so.

Many suggest states have not assumed the program based on the lack of Federal financial assistance. While this is a significant problem, a number of factors actually contribute to the assumption failure. The most often mentioned obstacles are EPA inflexibility, the lack of clear, consistent program goals, and the failure of the Clean Water Act to provide a well thought-out partnership role.

High on the list of obstacles is the inflexibility of the EPA. Guidelines issued by EPA are too rigid to allow states adequate leeway to design a permit program. EPA believes that the Clean Water Act program requirements for compatibility mean that states need to change their statutes and regulations to be identical to the rigorous Federal program. States should be allowed to design programs that are consistent with Federal program goals even if the program itself is not identical. Indeed one state testified that were this allowed, it would assume the permit program.

States have also objected to EPA's permit-by-permit review and veto. They have acknowledged the need for Federal oversight but object to EPA's individual permit veto. They prefer annual program reviews. States have also objected to the constant changes in program policy issues and the lack of state involvement in the regulatory decision-making process. States want a partnership role in consistent, stable program regulations.

NAHB supports the concept of wetlands conservation and management planning for states provided in S. 1304, but the specifics included in the bill make such plans virtually impossible for a state to complete. The plan requirements are extensive, and most must be completed prior to grant application. As stated above, most states do not have the funding to complete such tasks on their own. The carrot, provided in the form of possible financial assistance, is not predictable nor guaranteed. Monies must be made available at the onset of the planning process, not at the end. The President's plan, on the other hand, seeks to lure states into assuming responsibility by allowing partial assumption of the Section 404 program. Unfortunately, this plan does nothing to address the shortcomings of the existing assumption process, but simply allows a state to issue programmatic general permits, which are allowed under current law. Neither plan provides the necessary incentives for state involvement. The incremental changes proposed will simply perpetuate the current situation.

NAHB supports H.R. 1330, which not only encourages the establishment of state programs that address wetlands conservation on an ecosystem or watershed basis, but also establishes more flexible criteria to encourage state assumption and deference to local planning.

CONCLUSION

The result of our current wetland regulations is that in addition to wetlands being lost, jobs are also being lost, economic development opportunities missed, tax assessments are threatened, and housing costs are rising.

The past two administrations have, through the Grace Commission report and through Vice President Gore's "reinventing government" initiative, embraced the notion of streamlining government. No area of government cries out for this reformation more dramatically than our wetlands program.

It is time Congress reform this nation's wetland law, establish national policy, and put an end to simply maintaining the status quo. Accordingly, NAHB urges Congress to:

- * Transfer all authority for wetland permits to the Army Corps of Engineers;
- * Establish a responsible definition of water of the United States;
- * Exclude from regulation under Section 404 all land areas which currently fail to meet a strict three parameter definition of wetlands;

- * Focus wetland protection on our nation's most valuable wetlands by classifying all wetlands into three categories and provide regulatory protection accordingly;
- * Improve the regulatory process by establishing a wetland mapping system, an administrative appeals process and setting permit processing deadlines;
- * Develop a mitigation banking system;
- * Compensate property owners who own the highest category of critically significant wetlands; and
- * Require all program regulations and guidelines be subject to public notice and comment.

In short, we urge adoption of H.R. 1330.

National
Association of
Towns and Townships

**STATEMENT OF THE
NATIONAL ASSOCIATION OF TOWNS AND TOWNSHIPS
SUBMITTED FOR THE RECORD TO THE
SENATE ENVIRONMENT AND PUBLIC WORKS COMMITTEE
SEPTEMBER 22, 1993
REGARDING THE FEDERAL WATER POLLUTION PREVENTION
AND CONTROL ACT OF 1993**

The National Association of Towns and Townships (NATaT) appreciates the opportunity to submit testimony for the record on legislation to reauthorize the Federal Water Pollution Control Act (FWPCA).

NATaT represents more than 13,000 mostly small, mostly rural governments across the United States. These communities are typical of the nation's 39,000 general purpose local governments: 86 percent of local governments serve populations of less than 10,000 people and 67 percent govern less than 2,500 residents. Consequently, small communities represent the *majority* of governments in the United States.

Throughout the reauthorization of the Federal Water Pollution Control Act, NATaT encourages Congress to consider the ability of small communities to implement unfunded mandates. Local governments face numerous constraints because of limited financial and human resources and technical expertise. As a result, the resources needed to comply, implement, and pay for unfunded federal mandates are not readily available.

1522 K Street, N.W., Suite 600, Washington, D.C. 20005-1202
(202) 737-5200 FAX (202) 289-7996

The Federal Water Pollution Prevention Control Act of 1993 - S. 1114**State Revolving Fund**

Clean Water Act reauthorization legislation must recognize that small communities face unrealistically high cost increases in water and sewer bills as a result of compliance with present Federal Clean Water Act requirements. Small communities have been placed at a disadvantage when trying to obtain funding from state revolving funds (SRFs), particularly because they tend to lack bond ratings and have limited revenue generating capabilities compared to large municipalities. Therefore, the SRF funding mechanism should be structured to assist small communities with compliance, especially where costs of compliance are disproportionately higher than in large communities.

The provision in S. 1114, which allows state matching funds to be used *at state discretion* for grant programs to disadvantaged communities, begins to address the need to facilitate access by small communities to SRF monies. Unfortunately, this provision does not *ensure* that these communities will receive the funds that they desperately need to maintain safe water systems.

Small communities are projected to experience the greatest increase in annual user costs because of their inability to achieve economies of scale and their proportionately high operation and maintenance costs. As result, NATaT recommends a *small community 20 percent set-aside* within the SRF, to ensure that SRF programs obligate funds to those communities lacking the revenue base and management capacity to compete with larger municipalities for SRF monies. In lieu of the set-aside, NATaT supports more attractive and affordable loan repayment terms for small communities and therefore recommends that the current *20 year term* be extended to a *30 year term*, consistent with the useful lifetime of those plants. Twenty-year terms create unaffordable repayments for small communities with limited rate bases.

Although states have increased flexibility in setting SRF funding priorities and the provisions in S. 1114 allow funds to be used not only for construction of sewage treatment plants but also for combined sewer overflows, land acquisitions and new watershed management, NATaT believes that states should be required to establish separate categories of priorities for urban and rural facility needs in order to minimize competition for funding. NATaT is concerned that increasing the range of acceptable spending for the SRF without distinguishing rural and urban community needs will promote the distribution of SRF monies primarily to large urban areas.

Storm Water

NATaT has been concerned with the storm water program, particularly mandates to control storm water discharges from industrial sources. Although communities smaller than 100,000 in population have been granted a reprieve until October 1, 1994, many of our small communities will not know if they need to apply for such permits until the Phase II regulations are issued. The regulations could force local governments to expend significant amounts of money on programs for which they are not currently budgeting. Cost estimates of an application alone is in the range of \$500,000 to \$1 million.

S. 1114 narrows the scope of NPDES program applicability to storm water discharges and eliminates Phase II of the storm water regulations except for urbanized areas associated with the existing Phase I municipal storm sewer systems. S. 1114 specifically relieves towns and townships by allowing a 10 year moratorium on mandates to meet storm water effluent limits for municipal storm sewer systems serving populations under 100,000. Given the inability of EPA and the states to fully implement Phase I requirements, NATaT supports the provisions in S. 1114 which would eliminate the great burden of complying with pending Phase II requirements.

Alternative Technologies

The use of low-cost technologies and lower maintenance cost options should be encouraged to promote the development of affordable management and

treatment programs. For example, the use of constructed wetlands or lagoon systems can help small communities, individual households or rural subdivisions afford wastewater treatment. Rural areas are ideal for such innovative systems because they have available land area and a lower population density.

NATaT supports amending the Clean Water Act to provide specific incentives to foster the widespread development and research of new technologies by states and localities. In addition, EPA should be given the lead role in encouraging states to certify new technologies and approaches as permissible solutions. NATaT supports such a role for EPA which would further promote the development and implementation of innovative technologies.

Annexation and Wastewater Treatment

Small towns and townships particularly in the Midwest, have increasingly been confronted with the threat of annexation by municipalities if they are to receive wastewater treatment services from those municipalities. Annexation has been a problem since the days of the EPA construction grant program, despite EPA regulations that prohibit such actions. Frequently, municipalities have demanded that communities be annexed in return for services, even though the municipality included those communities in the prospective service area of the facility at the time the original grant application was generated.

To address this issue, NATaT recommends the inclusion of language in the Clean Water Act, specifying that municipalities may not threaten to withhold wastewater treatment services from systems constructed with federal financial assistance unless a community agrees to be annexed.

Non-Point Sources

Non-point source pollution has been a significant contributor to the remaining water quality programs in the U.S. Curbing non-point sources involves changes in land-use practices that traditionally have been the sole

province of local governments. As a result, local governments need flexibility within the state programs to improve watersheds.

NATaT supports the provisions in S. 1114 which would allow landowners in designated areas to put in place "best management practices" (BMPs) as outlined by the states to stem runoff from their property. Further, our towns and townships would greatly benefit by the option included in S. 1114 which allows landowners to develop site-specific plans for their land rather than complying with the more general state plans. The greater flexibility will facilitate local efforts to manage non-point source pollution and undertake non-point source management programs. This flexibility will also increase the variety of innovative management practices, institutional arrangements, and watershed projects.

Conclusion

With the decay of existing infrastructure, the diminishing federal role in public works investment, and the rising costs of meeting emerging environmental regulations, the reauthorization of the Clean Water Act should recognize that more stringent standards should not be imposed *unless such mandates are adequately funded.*

EPA's most recent needs survey places current wastewater treatment requirements at \$65 billion, with an additional \$110 billion needed over the next 20 years. These costs when combined with the costs to local governments for meeting all existing environmental mandates, raises legitimate concerns over the ability of local governments to provide environmental protection and solve environmental threats.

In order for our towns and townships to comply with these mandates, *federal funding and regulatory flexibility must be provided.* Funding must be set aside for small communities so that they are not forced to compete with large municipalities who possess the administrative, technical, and financial resources needed to access SRF monies.

Regulatory flexibility must be provided so that local governments can solve environmental threats that they have targeted. The goal is not to roll back environmental protection but allow for the development and implementation of alternative and innovative approaches to address environmental problems. Flexibility would only serve to encourage local governments to comply rather than violate federal environmental mandates.

NATaT appreciates the opportunity to comment on S. 1114 and is supportive of the efforts of Senators Baucus and Chafee in providing legislation to commence the national debate on the Clean Water Act.

**Written Comments of the
National Marine Manufacturers Association (NMMA)
on S. 1114
The Water Pollution Prevention and Control Act of 1993
to the
Senate Environment and Public Works Committee**

General Comment

NMMA agrees that further investment in water quality protection is essential and that additional resources must be made available to State and municipal governments to further the goals of the Clean Water Act (CWA). NMMA is also pleased that S. 1114 acknowledges the central importance of well grounded science as a basis for regulation, coupled with an acknowledgement that affordability and economic impact issues must also be considered. However, NMMA is generally concerned that the bill significantly rewrites the CWA, one of the most successful major environmental laws enacted, and makes the law more prescriptive. NMMA believes that the flexibility inherent in the CWA must be preserved so that public and private interests will have the fullest opportunity to eliminate the remaining threats to our Nations's waters in the most cost-effective manner.

Specific Comments

1. Section 304 requires the U.S. Environmental Protection Agency (EPA) to develop national guidance for nonpoint source control that specifies management measures and program implementation criteria. This approach sounds very similar to the recently enacted guidance under Section 6217 of the Coastal Zone Management Act (CZMA) which will apply in the twenty-nine coastal states where a majority of our members are active. NMMA strongly urges the Committee to consider creating a single regulatory program for nonpoint sources of pollution, or conversely to legislate the compliance with the CWA nonpoint sources provisions will be deemed compliance with the CZMA nonpoint source requirements, or vice versa. The regulatory burden on our members of having to comply with two essentially identical programs would be confusing and unnecessary.

2. Section 402 amends the stormwater permit program, primarily as it relates to municipal discharges. The control of stormwater sources that currently do not require a permit (Phase II sources) is to be further studied. NMMA believes that Phase II stormwater sources should be rolled into a single CWA\CZMA nonpoint source control program, as discussed above.

3. Section 302 provides new authority for voluntary watershed management programs at the state level which would comprehensively manage all sources of pollution in a watershed. NMMA supports the concept of hydrologically-based water pollution control, but is concerned about the possibility of significant variations in requirements from watershed to watershed, as well as the potential for dual regulation in interstate watersheds. NMMA believes that some minimum form of national watershed program guidance to states is necessary. In addition, NMMA believes that in any allocation of water pollution reductions between point and nonpoint sources within a watershed, credit should be given to nonpoint sources for any voluntary nonpoint source reductions that are made in excess of CWA/CZMA requirements. NMMA also believes that compliance with all sediment and water quality standards cannot be achieved in ten years, as required by the bill. This requirement should be extended to 15 years or more in order to avoid unnecessary litigation against watershed planners for failure to meet deadline.

4. NMMA believes that S. 1114 should explicitly support/authorize the use of economic incentives to reduce water pollution, such as point/nonpoint source trading.

Any questions on these comments may be directed to Mary M. Mann, NMMA Director of Federal Government Relations [(202) 944-4980].

WRITTEN STATEMENT OF GERALD E. DORFMAN

PRESIDENT

NATIONAL UTILITY CONTRACTORS ASSOCIATION

PREPARED FOR THE

**SUBCOMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE
UNITED STATES SENATE**

***THE UNSEEN CRISIS:
AMERICA'S CRUMBLING CLEAN WATER INFRASTRUCTURE***

SEPTEMBER 1993

CONSTRUCTORS OF WATER, SEWER AND UNDERGROUND UTILITY SYSTEMS

Mr. Chairman and members of the Subcommittee, I am Gerry Dorfman, President of the National Utility Contractors Association (NUCA). NUCA represents contractors, suppliers, and manufacturers across the country who construct the sewer and wastewater treatment facilities financed through the Environmental Protection Agency's State Revolving Loan Fund (SRF) Program. I have been in the business of building water supply and wastewater treatment facilities for over thirty years and presently serve as President of Dorfman Construction in Woodland Hills, California.

I am pleased to provide my industry's insights and recommendations regarding reauthorization of the Federal Water Pollution Prevention and Control Act and S. 1114 in particular. Foremost, we support the existing Clean Water Act's general structure and the wastewater treatment construction financing mechanism. Capital funding levels, however, have been woefully inadequate. A minimum \$5 billion annually is needed to meet secondary sewage treatment needs alone. To close the gap between water infrastructure needs and projected federal, state, and local investment, NUCA recommends the study of dedicated revenue sources. We support the elimination of the SRF funding restriction on sewer collectors and combined sewer overflow corrections, but strongly oppose eliminating the restriction on funding land acquisition. Furthermore, NUCA seeks to require that all federally assisted clean water projects be publicly bid and awarded to the lowest responsive bidder. Finally, and perhaps most importantly, the wetlands reform debate must not hold the clean water construction program hostage.

I. THE SITUATION AT HAND

The various scientific studies and statistical assessments that document water pollution problems are important but sterile. They fail to convey the nature of the harm in every day terms. I want to tell you first-hand that the water infrastructure needs in the United States are tremendous, in terms of the investment required for construction and rehabilitation and in terms of the devastating social, environmental, and economic opportunity costs that result from our reluctance to devote sufficient resources to the problem.

A renewed federal commitment to clean water construction should not be a tough choice. I don't need to tell you the importance of maintaining fresh water supplies. Clean Water Act construction programs have improved the quality of the nation's water resources immensely to the benefit of all. Nevertheless, clean water construction funding remains a top national priority.

A. Deteriorating Sewer Systems

Not long ago, my company replaced a septic system that served a rural neighborhood in Northern California. Financing for the job was provided by the federal government. While I was prospecting the site before preparing my ultimately successful bid, I was absolutely dumbfounded to discover that the families' backyards were saturated with raw sewage that had overflowed from failed leaching systems. These families were literally trapped in their homes. The children could not play outside. The entire neighborhood was a public health hazard. The impact on the quality of life was immeasurable. The federal investment in this community was necessary and sound, and it is important

for me to tell you that the neighborhood is thriving since the completion of the job.

The sewer problem is urban as well as rural. On a project for a major city in Southern California, we recently replaced a sewer pipeline that had failed earlier than expected due to unstable ground conditions. When we uncovered the pipe, we found gaping holes where raw sewage had been escaping into the surrounding ground for an unknown period of time. The devastating part of the story is that the collapsed system was located less than 100 yards from a fresh waterway. Whenever the tide rose, the pipe carried fresh water to the treatment plant. When the tide went out, so went the sewage. We had uncovered a daily exchange of raw sewage and fresh water.

B. Combined Sewer Overflows

A second problem occurs with combined sewage overflows. On a project in the Northwest, our firm replaced a large-diameter brick sewer built in the early 1900s. There were numerous delays when work was suspended due to heavy rainfall. On more than one occasion, I stood with my superintendent watching raw sewage and rainwater discharge into a river because the infrastructure could not process the influx added by the storm. This was not an isolated event. All 1,100 of the nation's combined sewer systems need to be augmented so they function as a storm system or a sewer system, not both.

C. Leaking Drinking Water

Thousands of miles of old and decaying drinking water lines also contribute to water pollution. My son recently replaced a 10,000-foot water line for a community in Southern California. He was continually plagued with suspension of work because the adjacent line, which his work was to replace, leaked like a sieve. As you can imagine, this situation entailed an incredible loss of water to the community as well as enormous construction costs, but that is not my point. The leaking clean water contributed to water contamination when it merged with sewage from leaking sewers beneath. The increased volume of contaminated water flowed to the closest aquifer or waterway. In addition, some of the leaking clean water entered the sewer and returned to the treatment plant. The water pollution ramifications of a drinking water system failure are extensive. The people who suffer the consequences are unsuspecting, downstream.

D. Lessons From Experience

I have drawn a number of observations from these and other experiences in the field since the Clean Water Act was last amended in 1987. First, I find it particularly poignant that all of my fellow NUCA members, from any state in the land, could tell similar stories. That is the appalling reality of the situation, despite great progress under the Clean Water Act. Second, the most important needs are not new or particularly complex. It is simply a matter of core infrastructure -- pipes in the ground -- falling apart because they have not been replaced in half a century. Too often, we try to construct bigger and

better treatment plant facilities, while ignoring the source of the problem. An incisive and rigorous attack at the source, the ancient pipes, will effectively stop contamination of water supplies. In addition to these important traditional needs, we must simultaneously address new threats to water quality.

Third, and despite the frequent occurrence of water quality emergencies such as those I have described, Americans continue to ignore the water infrastructure crisis because collection, delivery, and treatment facilities are generally out of site and out of mind in the absence of crisis. Unlike a pothole in the highway, you cannot preempt a water catastrophe unless you look for it.

Forth, the problem itself has become so egregious that even individuals familiar with the issue are repulsed by the massive remedy that is so clearly necessary. Too often, a listener's eyes glaze over when I mention a growing \$200 billion clean water infrastructure deficit. The cynic in me wonders how many deaths, such as those caused by the recent water contamination crisis in Milwaukee or the sink hole in Atlanta must occur before we get serious.

Fifth, correcting these problems will generate immediate and lasting economic benefits. Functioning clean water infrastructure is an obvious and absolute precondition for industry, agriculture, retail commerce, professional services, government, schools, hospitals, emergency services, recreation, affordable housing, and everything else. Furthermore, the people who work for me do not consider their careers make-work. They are educated, make good wages, pay plenty of taxes, save a little, and plow the rest right back into the private sector.

II. S. 1114 AND NUCA RECOMMENDATIONS

A. Funding

1. \$5 Billion Annually

For the eight-year period 1993 to 2000, NUCA recommends annual authorized funding of at least \$5 billion for the wastewater SRF Program. This recommendation corresponds to the most conservative assessment of investment needs -- investment needs above and beyond what the states are likely to spend themselves. We have not inflated our estimates, and we cannot in good conscience recognize lower funding levels as adequate. We applaud the authors of S. 1114 for their attempt to reach the \$5 billion level.

2. Dedicated Revenue

NUCA strongly supports the creation of a new revenue generating program targeted directly and exclusively to clean water infrastructure. This revenue raising program should incorporate a user-fee principal, such as a sewer hookup fee or a fee on water use. We encourage the Subcommittee to explore new sources of dedicated revenue for needed clean water infrastructure and recommend that S. 1114 be amended to require a study of revenue raising alternatives.

B. Structure Of The Program**1. Loans, Not Grants**

NUCA does not play a direct role in the administration of federal clean water funds. Companies in our industry bid on funded projects when bids are solicited by project owners. Nevertheless, the utility construction industry has a direct stake in the efficient use of limited federal resources. NUCA favors the continuation of the State Revolving Loan Fund Program (SRF). While the SRF can be implemented more effectively with minor legislative adjustments, its fundamental characteristics are preferable to direct grants.

First, we embrace the intent of the program, which is to provide states with a revolving, permanent pool of capital. Of equal importance is the fact that SRFs can be leveraged to create bigger lending pools. Extended amortization periods beyond the current 20-year maximum loan term and loan principal subsidies are some of the adjustments that should be made to make the SRF more attractive source of financing to small or hardship communities that have not been able to participate.

NUCA opposes funding for project-specific grants because they encourage communities to postpone projects in the hope of receiving a grant and tarnish the reputation of the construction program by calling into question the fair distribution of federal resources. Moreover, the Rural Development Administration already administers a growing wastewater treatment grants program for small communities that cannot afford loans.

2. Eliminate The Restriction On Sewer Corrections

NUCA strongly favors the elimination of restrictions on funding sewer collectors and combined sewer overflows as proposed by S. 1114. The experiences described earlier demonstrate the necessity of removing the current restriction in Section 201(g)(1) of the Federal Water Pollution and Control Act. In addition, NUCA opposes the inclusion of special earmarks or set-asides designed to address singular water pollution problems. Each state should be given the flexibility necessary to address its unique blend of needs.

3. Land Acquisition

NUCA supports the current restriction on the use of SRF funds for the purchase of land. We recognize that this restriction may make the SRF a less attractive source of financing in some communities, especially rural communities that require land for collectors and interceptors. Nonetheless, we believe that the SRF funds must not be diluted at this time for this purpose.

4. Private Sector Design And Construction

We recommend that S. 1114 include the requirement that all clean water infrastructure projects funded by the federal government must be publicly bid. This stipulation will ensure that public works projects are designed and constructed only by private sector firms, which must pay federal taxes and comply with federal OSHA requirements.

5. Administrative Costs

The amount of money in an SRF that may be used for administrative costs is presently limited to four percent of the federal capitalization grant received by the fund. It has been suggested that the four percent limit can prevent efficient SRF administration -- especially in states that leverage their fund. NUCA encourages the Subcommittee to explore ways to increase the administrative efficiency of the SRF that do not require the use of precious appropriated capital funds to cover operating costs. A small percentage of each state's total fund for administrative purposes is one such alternative.

C. Wetlands Regulatory Reform

The United States is in urgent need of a comprehensive and coherent national wetlands program that protects vital wetlands from destruction, allows for the delivery of essential public services, minimizes burdens on the small business community, and enhances the overall quality of life. NUCA believes that federal decision-making power regarding wetlands management should be consolidated under the auspices of a single agency -- preferably the U.S. Army Corps of Engineers. Wetlands should be clearly defined, classified, mapped, and indexed. The level of protection for each classification should correspond to its ecological value. Lands of marginal ecological value should not be regulated. Permit application procedures should be streamlined and include a reasonable deadline for permit decisions. An administrative appeals process should be established to handle permit denials, administrative

penalties, and jurisdictional disputes. While NUCA supports reform of federal wetlands management, we are very concerned that congressional consideration of the wetlands issue will substantially delay or even preclude reauthorization of the Clean Water Act during the 103rd Congress. The wetlands reform debate must not hold the clean water construction program hostage.

III. CLOSING

At NUCA, we suspect that federal funding for clean water facilities is more important to the families of this country and the future of this country than much of the domestic discretionary budget. The need for increased capital funding and new sources of funding cannot be emphasized enough.

We commend this Subcommittee's determination to reauthorize the Clean Water Act by the end of this year. S. 1114 is a good starting point for discussion, and we appreciate the opportunity to present the views of the underground utility construction industry.

###

TESTIMONY

OF

WILLIAM B. SCHATZ
General Counsel

Northeast Ohio Regional Sewer District
Cleveland, Ohio

BEFORE

THE

SENATE ENVIRONMENT AND PUBLIC WORKS COMMITTEE,

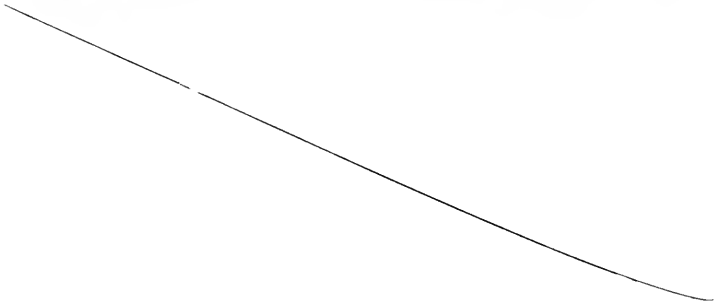

SUB-COMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE

August 4, 1993

Mr. Chairman and members of the Committee, I appreciate the opportunity to present testimony to you today. My name is William B. Schatz, and I am the General Counsel of the Northeast Ohio Regional Sewer District. Our wastewater treatment agency collects and treats the wastewater for the residents and industries of the City of Cleveland and some 50 other communities in the northeast Ohio area. We were created by an Order of the Cuyahoga County Common Pleas Court in 1972. Since that time, the District has spent over \$1 billion on construction projects to upgrade and improve water quality in the greater Cleveland area. One of the results of these efforts has been the tremendous improvement of water quality in Lake Erie and the Cuyahoga River.

The District owns and operates three major facilities within its service area. The Westerly Wastewater Treatment Plant, which is on the Lake Erie shoreline west of Cleveland, was rehabilitated and converted to a physical chemical treatment process commencing in 1974. The District's overall expenditure exceeded \$120 million for the upgrade of this 50 million gallon per day facility. Much of the facility was financed in part by the use of USEPA construction grant funds.

The process selected by the District was one which was touted by USEPA during the late 1960s and early 1970s as the technology of the future, particularly for facilities which treated high concentrations of industrial wastes. Rather than utilize conventional biological treatment, the process relied on removal of the solids through sand filters and carbon adsorption. During the course of construction, a number of problems were encountered both with the various phases of the

Page 2

process and with certain equipment.

Through the early and mid 1980s, the District diligently dealt with construction and equipment problems and committed to the successful operation of the facility. After spending additional funds to change components of the system and process, a study of the facility was undertaken in 1989 to ascertain if the process would work. The study concluded that the process was fundamentally flawed and would not enable the District to meet its NPDES permit limits for the Westerly treatment works. The District then decided to abandon and remove portions of the plant related to the physical chemical process and install a conventional biological facility with aeration and trickling filters.

A consulting engineer was retained by the District. After two years of design effort, construction commenced with a contract for site preparation. Three new contracts were let this year to upgrade the facility, and construction is now underway to convert the plant into a biological treatment operation. The cost of the actual conversion to a biological process is approximately \$35 million, although with engineering and other costs incurred by the District, the overall cost will be several million dollars.

In addition, USEPA has brought an enforcement case against the District because the plant does not meet its effluent limits. The District has asserted a defense in this litigation with USEPA, claiming that it relied on the technology then touted and urged upon the District by USEPA. Also, auditors of the Office of the Inspector General during the construction grant close-out audit have set aside those portions of

Page 3

the total cost funded with USEPA construction grants that are related to the flawed technology. This set aside means that the funds might be declared as eligible after the plant has been converted to a biological process and then meets its permit limits.

I appear before you today to request your assistance in obtaining recognition of this problem, and acknowledging the need for an authorization of an amount not less than \$35 million to assist the District in the reconstruction of this facility. This request is made with the caveat that there should be some fundamental fairness in the manner in which the users of the District's system are treated when they rely on representations made by the Federal government.

The rationale is that the District did rely on technology at this facility that was recommended and approved by USEPA. Without exception, other facilities constructed using this technology have all been converted to another process or otherwise rehabilitated. Several have received assistance through additional USEPA construction grants, which are, however, no longer available to our District or other agencies. Arguably, had this facility been funded at the time when innovative or alternative construction grant funding was available, the facility would have qualified for such funding. Thus, the result of the failure of the process would provide that USEPA participate with funding at a level of 100% to rebuild the flawed technological portion of the treatment works.

The Westerly Wastewater Treatment Plant was the largest application of the physical chemical treatment technology in this country, and of course the largest facility which was unable to meet permit limits. The

Page 4

District spent several years and millions of dollars of its own additional funds to try to make this facility achieve its permit requirements. Now, the District must not only face the burden of the reconstruction of this facility, but must defend the lawsuit brought by USEPA. While we recognize that funding of specific projects in today's legislative environment is difficult because there are fewer discretionary funds available, we believe that this situation is so unique that it cries for the relief we request. We also seek through legislation an acknowledgement that the District's problem of permit noncompliance is not of its making, and given the fact that USEPA participated in the selection of and urged the flawed process, no civil penalties should be assessed against the District.

In closing, I again would like to thank the Chairman and members of the Committee for your time. I would be pleased to provide any additional information for your consideration. I once more urge that the citizens of northeast Ohio receive the fair treatment to which they are entitled caused by this mistake, and that they not have to shoulder alone the burden of the cost of the change of this process.

Comments of the Northwest Marine Trade Association

on S. 1114

The Water Pollution Prevention and Control Act of 1993

Provided to the Subcommittee on Water Resources
Committee on Environment and Public Works
United States Senate

Thank you for the opportunity to submit this written testimony for the record. Our Association, representing over 1,000 member firms in the Pacific Northwest, supports the goals of this reauthorization of the Federal Water Pollution Control Act. The recreational boating industry is dependent on clean water for boating, fishing, sailing, diving, and other activities engaged in by boaters throughout our nation.

Boatyards, marinas, and boatbuilders in the Northwest have made a strong commitment to achieving compliance with the current provisions of the Clean Water Act. This compliance effort has been expensive to implement, necessitating an increase in costs to the end users, and the boaters themselves. Unfortunately, the price being paid by boaters, and the efforts of our industry along with other point source permit

holders, have not resulted in an acceptable level of water quality. Nonpoint pollution has now been identified as the major contributor to water quality degradation and S. 1114 begins to address this source of pollution.

NMTA concerns with the bill include the following:

Section 501 permit fees. Our concern is not with the fees but the lack of fiscal accountability levied upon the states in regard to collecting and administering the fees collected. The bill requires funds be spent only on water quality programs, but does not provide methods of insuring a state's program is run efficiently or that funds are spent wisely. Also lacking is some form of permit fee relief for reducing or eliminating all pollutants from a permit holder's discharge. Washington State's entire water quality program is funded 100% by fees paid by businesses. This current biennium, Washington will be assessing over 20.7 million dollars in permit fees on approximately 2,300 permit holders. Some small companies may see fees for a general storm water NPDES permit run from \$900 per year to a high of over \$100,000 per year. Industrial or process NPDES permit fees may begin at \$500 and run to well over \$100,000 per year. When a state or state agency ceases looking at fees as an offset to the cost of administering the water quality program and begin to look to fees as their sole funding source, then fees have ceased being fees and become in fact taxes for operating a business that utilizes and discharges water for producing a product or service. If section 501 does not provide for a level of fiscal accountability in an agency, then the cost to businesses all over our country will continue to climb unchecked. Fiscal responsibility must be included in this section of S. 1114.

Section 304 requires the Environmental Protection Agency to create a National Program Guidance which sounds identical in nature to the recently implemented 6217 nonpoint guidance manual implemented under the Coastal Zone Management Act. Representatives of our industry spent significant effort working with EPA and NOAA in attempting to create a program within 6217 which would work in our waterfront marine facilities. The final guidance under 6217 is still flawed in its limited approach to addressing nonpoint pollution in our marinas and boatyards. The new program envisioned within S. 1114 appears to provide the needed flexibility lacking in 6217 and would make compliance easier for our industry. What must be done is to provide within the law a manner for the States to select which program they wish to administer. Applying two separate but similar programs through two different federal agencies will only lead to confusion and poor implementation of both programs.

Section 502(f) requires the Administrator of EPA to draft regulations which would require a permit applicant to characterize the nature of their effluent discharge and the contribution of that effluent to the receiving waters. We can support the requirement to identify all the constituents within an effluent discharge, but many small business operators lack sophistication in the permitting process and will be unable to relate their discharge to the makeup of the receiving waters. To contract with a consulting engineering firm to accomplish this requirement will be quite expensive. A manner of achieving the desired goal of the bill within the level of knowledge and skill of small dischargers needs to be found.

Finally, section 302 would create a comprehensive watershed management program for the nation. We support this approach to pollution prevention because it appears to bring both point and nonpoint source reduction into proper focus. There is concern though that the watershed planning process would result in different rules, practices, fees, and requirements for each watershed. A boatyard in one watershed would not be able to provide services available on other watersheds or the service charges would differ due to higher fees or more expensive pollution abatement requirements. For marinas (moorage facilities), the regulations and practices could vary from marina to marina based on which watershed the facility is located upon. This would offer unfair competitive advantages to one over the other. In many cases this problem already exists between states with differing regulations. Because boats may sail easily from place to place, the regulations governing their use, moorage, and repair must be similar if everyone is to understand their responsibilities and to prevent flight from watershed to watershed and provide equity among businesses in different watersheds.

An important component of the bill is education. As pollution prevention is applied to smaller and smaller businesses, the ability to comply becomes much more difficult. First and foremost is the total lack of knowledge of a law to be complied with. Secondly when a business learns of a requirement's existence, it has little or no idea of what it should do. But because small business people are closer and more involved in their respective communities than most large corporations, they have a greater sense of responsibility to their communities's well-being. Awareness of

environmental responsibility and the sense of duty to protect our environment is created by education and information not by laws in a book.

The recreational boating industry, its service providers, and boaters, along with representatives of the Sea Grant program and the environmental community, created a plan for a national education program for marina and boatyard operators throughout the country. The "CleanMarina Program," administered by the International Marina Institute and directed by an industry committee would provide a comprehensive water quality peer group educational program. The "CleanMarina Program" would fit the spirit of the educational efforts prescribed in S. 1114 and would provide workshops and pollution prevention materials within two years of funding. We urge the Committee to include a provision in the bill for the support of the boating industry's "CleanMarina Program" and to support its passage. A "CleanMarina Program" proposal is attached.

Northwest Marine Trade Association supports the effort of the Environment and Public Works Committee in attempting to find solutions to our nations water quality problems. We hope these comments will assist the Committee in making this reauthorization process one that is truly effective and economically achievable.

Thank you for considering our comments. Questions may be addressed to Hal Schlomann (206) 634-0911.

Re: Clean Water Act Reauthorization

Dear Mr. Chairman:

Forwarded for inclusion in the record of the proceedings of your subcommittee is my statement on behalf of the Silver Coalition, an ad hoc group of trade associations, technical societies and governmental agencies that are vitally affected by environmental regulations on silver.

Unnecessary and burdensome silver regulations are adversely affecting photofinishing, medical, dental and industrial motion picture developing, printed circuits, manufacturing, surveying, land use planning and other systems that utilize silver as the image-capturing ingredient.

We look forward to working with your staff and appreciate the cooperation and willingness to listen that has already been demonstrated.

Sincerely,

A handwritten signature in cursive script that reads "Thomas J. Dufficy".

WRITTEN STATEMENT OF
THOMAS J. DUFFICY
NATIONAL ASSOCIATION OF PHOTOGRAPHIC MANUFACTURERS
ON BEHALF OF
THE SILVER COALITION

BEFORE THE
U.S. SENATE COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS
SUBCOMMITTEE ON CLEAN WATER, FISHERIES & WILDLIFE

SEPTEMBER 15, 1993

Mr. Chairman, thank you for the opportunity to present this testimony for the record of your hearings on the reauthorization of the Clean Water Act. I also want to thank the Committee staff for their attention in meeting with representatives of the Silver Coalition about our interest in the Clean Water Act and our suggestions for legislation.

The Silver Coalition is an ad hoc group of trade associations, technical societies and governmental agencies that are vitally affected by environmental regulations on silver. In particular, the Silver Coalition is interested in the water quality standards for silver that result in effluent limitations and pretreatment requirements based on those standards.

The Silver Coalition has been working for some time with the Environmental Protection Agency on these questions, including extensive technical and policy discussions of the appropriate water quality criteria for silver. The Coalition seeks to have the criteria and State-adopted standards reflect the latest scientific information on the potential toxicity of various forms of silver, rather than base such standards on total recoverable silver. The Agency has been responsive in these discussions, and appears to be moving in a positive direction in recent guidance documents. In order to support this movement, and to provide appropriate relief to silver users while these changes are being implemented, the Silver Coalition has identified some areas for possible legislative action.

Background

Currently, over fifty percent of the silver used for industrial purposes in the United States is used in the manufacture of photographic materials. Electrical and electronic product manufacturing accounts for approximately twenty-five percent; sterling ware, electroplated ware and jewelry manufacturing accounts for approximately twelve percent; and brazing alloys and solders manufacturing accounts for about five percent.

The ability to communicate rapidly - "a picture is worth a thousand words" - makes photographic imaging a vital part of people's daily lives, and has greatly enhanced our ability to study the Earth through aerial photography and to assess the need for medical treatment

of injuries and disease through x-ray technology. Photoprocessing activities occur at a variety of industries including photofinishing, medical, dental and industrial radiography, graphic arts and printing, motion picture developing, high-tech printed circuit manufacturing, surveying and land use planning, and a variety of specialized imaging applications, as well as at government agencies. It is estimated that these processes are conducted at more than 550,000 facilities in the United States. These include over 320,000 health care facilities such as hospitals, dental offices, and veterinary clinics. Also included are almost 50,000 non-commercial facilities including photofinishing labs, graphic arts shops, and motion picture studios.

Exposed photographic films or papers must be processed through an on-site photoprocessing facility or use an outside commercial processing laboratory to produce an image for subsequent viewing or printing. After processing, photographic films or papers are then rinsed in cascading water washes to remove the remaining photographic developers. Over the past twenty years, research & development efforts have greatly reduced the chemicals usage needed to process images, in some cases by over 90%.

The remaining processing solutions containing silver can be treated in silver recovery equipment to remove 99% of the silver for later refining and reuse. Silver reclamation is profitable for photoprocessors and is supported by a competitive marketplace which purchases reclaimed silver. Normally, after the removal of silver by recovery units, the processing solutions and spent wash waters are discharged to municipal wastewater treatment systems.

All conventional photoprocessing methods will generate silver-bearing wastes. The silver in the films and papers is removed during processing and will primarily be present in the photographic fixer solutions. These silver-bearing solutions are normally treated on-site with silver recovery techniques, typically electrolytic, metallic replacement, ion exchange, chemical precipitation or combinations of these. The treated fixer is then combined with the other processing wastewater and sent to a publicly owned treatment works (POTW) for further treatment. EPA data show that over 97% of the photographic films and papers used in the United States are processed in facilities utilizing silver recovery. Over 99% of the silver in spent silver-removal processing solutions is easily and economically recoverable. Any trace quantities of unrecovered silver remain in process wastewaters which are sent to POTWs for additional treatment. Silver is not typically recovered from wastewater treatment sludges from POTWs because of relatively low concentrations in the sludge material.

Because silver is a precious metal, photoprocessors and other silver users have a powerful incentive to minimize the discharge of silver. EPA first studied silver discharges from photoprocessing facilities as part of its responsibility to establish industry-wide effluent guidelines and categorical pretreatment standards. Their data showed that over 99% of their discharges were to POTWs, with few direct dischargers to rivers or streams. As a result of these studies, EPA concluded that the economic benefits of silver recovery drove most dischargers to install in-process control equipment; and therefore, Best Available Technology (BAT) levels are being achieved in this industrial category. In 1981, EPA decided against establishing a categorical pretreatment standard for photoprocessors as unnecessary. Since then, a number of process improvements have been implemented in the photoprocessing industry to conserve water and improve effluent quality further.

Improved Water Quality Science: Limited Toxicity for Silver

In laboratory toxicity tests, free silver ions can result in aquatic toxicity. In fact, silver is used in some water supply systems as a disinfectant because of the toxicity of the free silver ions. Some weakly-bound silver complexes may exhibit aquatic toxicity in the laboratory. In the real world, however, the toxicity of silver is far less than can be created in the laboratory. Effluent streams from photoprocessors and most other silver users do not contain toxic forms of silver. Under conditions in the natural environment, dissolved silver in a waste stream quickly reacts with naturally occurring substances or sediments to form silver compounds with substantially reduced toxicity -- in some cases, almost 1 million times less toxic than the free silver ion. Silver is also known to cause no human health effects. This fact was recognized by EPA's Office of Drinking Water in the deletion of the primary maximum contaminant level (MCL) for silver in January, 1991.

EPA's current water quality criteria for silver are based on data collected over 15 years ago and were first published in 1980. These criteria were later incorporated into the Agency's "Gold Book". The acute criteria were hardness based, about 4.3 ug/l for a 100 mg/l hardness water. EPA decided against establishing chronic criteria because the long-term exposure data were difficult to interpret and the acute criteria appeared to be fully protective of long-term exposures. In 1990, EPA published a new draft Silver Criteria Document that proposed chronic water quality criteria. However, the issues cited in the 1980 document remained unresolved, and as a result of public comment, the 1986 "Gold Book" criteria for silver (acute only) were retained.

As required by the 1987 amendments to the Clean Water Act, States were moving to set water quality criteria for listed toxic pollutants, including criteria for silver. Unfortunately, many States adopted, in some form, the 1990 draft silver criteria, although they were never made final. To prevent further confusion, in June 1992, EPA clearly stated that there was no Federal chronic criteria for silver and the Agency did not encourage States to establish their own chronic standard (this was communicated by a letter from Mr. Tudor Davies to EPA Regional offices and State Water Directors). In the final National Toxics Rule (December 1992), EPA formally retained the 1986 "Gold Book" acute criteria for silver, deleted the human health criteria, and again declined to establish chronic criteria.

Over the same time frame, the scientific community has been actively advancing its knowledge of the fate and effect of silver in the environment. Scientists have studied both the impact of water chemistry on silver's toxicity (i.e., chemical speciation), as well as silver interactions with particles, such as silts and clays (i.e., particle adsorption). Silver's intrinsic reactivity makes it quickly combine with natural organics or sulfides or strongly bind with particles to form far less toxic (non-biologically available) chemical forms.

In addition, new "clean sampling" and analytical methods and improved filtration techniques are revolutionizing water chemists' understanding of the actual behavior of metals in the environment, including that of silver. Almost all of the past data collected on metals is now suspect and may provide little, if any, help in determining appropriate discharge rates for metals. Some scientists refer to this as a renaissance era for the study of metals. Unfortunately, as a 1992 report by EPA's Science Advisory Board (SAB) states, "... the importance of chemical

speciation and biological activity is being ignored . . ." in the determination of water quality criteria and standards. The difficulty lies in translating the laboratory-derived silver water quality standards into the real world. Presently, the use of the Total Recoverable Metals (TRM) analytical method means that all forms of silver are treated as equally toxic. This results in over-regulation.

EPA's conference on metals in the environment in Annapolis, Maryland (January 1993) reached a similar conclusion to that of the SAB, where the great majority of scientists recommended that *dissolved* metals be used as one tool in setting water quality standards, rather than total recoverable metals. An EPA summary of the conference, published in the Federal Register on June 8, 1993, said "the dissolved metal concentration better approximates the bioavailable fraction of waterborne metals than the total recoverable concentration of metals. . . . On balance, the assembled experts at the workshop recommend that the existing water quality criteria values be applied as a dissolved metal concentration as the dissolved metal concentration is currently the better estimate for bioavailable metal fractions." EPA will soon publish a guidance document advising Regional Offices and State Water Directors that water quality standards and criteria for metals such as silver can be interpreted to be measured in terms of dissolved metals

Problem Statement

The impact of the States' premature adoption of these very low silver water quality standards, resulting from an outdated view of silver's toxicity, is now being felt as POTW permits are established and overly restrictive pretreatment limits are being enforced. Stringent water quality standards resulting from EPA's proposed (but never promulgated) criteria have caused municipal wastewater treatment systems, in turn, to establish strict pretreatment standards for total silver -- not just the toxic free silver ion forms -- in order to comply with their newly revised discharge permit limits. (See the attached diagram.) Many pretreatment limits have been set at 0.1 mg/l (or 100 ppb) or below (or at the limit of detection for the POTW), which cannot be consistently met with current silver recovery technology or other treatment equipment available for most photoprocessing facilities. Using state-of-the-art electrolytic and metallic replacement equipment, silver concentrations can be reduced by 99%. However, to achieve a 0.1 mg/l or lower pretreatment standard, all of the used photochemicals and wash waters must be containerized and transported off site for further treatment. The Silver Coalition is aware of many cities where this is occurring or has been threatened, including Atlanta, Reading and other communities in Pennsylvania, and cities in Florida, Texas and New Mexico.

It is estimated that over 550,000 photoprocessing facilities in the United States will be affected by the stringent regulation of silver. These facilities employ nearly 3 million people to operate and maintain photoprocessing equipment, and support millions of additional jobs associated with the conduct of their primary business.

To establish a general understanding of the potential costs associated with varying degrees of control for silver, the Silver Coalition estimated the monthly discharge volumes by type of facility and calculated the cost of achieving four different pretreatment standards. The analysis of these case studies shows the potential capital costs facing the photoprocessors in the U.S. runs from a low of \$65 million to a high of \$25 billion if the most stringent standards are imposed.

Increased annual operating costs could reach \$10 billion. As standards are tightened, the rapidly escalating costs have a profound effect on the photoprocessing industry. Smaller photoprocessing businesses will be forced to drop-out and the industry will become centralized, controlled by a fewer number of large players. The larger, surviving facilities have a greater potential to afford the costly treatment equipment (both from a capital cost and operating/labor cost perspective), to achieve the low pretreatment levels, or to deal with hazardous waste management standards.

Proposed Discharge Limits (mg/l)	Projected Capital Costs (\$ million)	Projected Annual Costs (\$ million/year)	Facilities Consolidated due to Standards
No lower than 5	65	45	negligible
Between 1 and 5	11,300	3,200	60,000
Between 0.1 and 1	11,300	6,200	200,000
Less than 0.1	25,400	9,800	360,000

These costs are substantial and significant in financial and employment terms. Implementation of the most stringent requirements could lead to the loss of more than 800,000 jobs. While some jobs would be created in the larger photoprocessing centers induced by the regulation, the transportation sector, or treatment equipment fabricators, these jobs will not offset job losses in the small business sector.

The consequences of these changes will be great. Photoprocessing facilities in small hospital x-ray departments (or dental offices) might close and require shipping of the exposed film to centralized facilities for processing. The increased turn-around time would reduce the doctor's diagnostic capabilities and add to the total cost of health care in this country. Many police department actions could be slowed as identification laboratories are centralized. Newspapers and advertisers might require much longer lead times and deadlines. These trends are in the wrong direction.

Many regulatory agencies and the public at large will be adversely affected, as well. The availability of tax dollars is limited. The inappropriate regulation of silver means that Federal, State, and local regulatory agencies are spending time and resources controlling *de-minimis* risks from silver-bearing discharges and wastes which could be devoted to more important problems.

Recommended Changes to the Clean Water Act

The underlying water quality science for silver has been evolving rapidly over the last five years. Researchers now know that silver rapidly combines with naturally-occurring substances and sediments to form far less toxic complexes. They also have shown that laboratory tests using the most toxic form of a metal do not provide realistic estimates of field conditions. Various studies have shown that silver's toxicity is greatly moderated after use in photoprocessing, reduced even more after biological treatment at POTWs, and any remaining impact is quickly eliminated upon discharge into the environment.

Unfortunately, EPA's and the States' current regulatory structures are not well equipped to respond to this new scientific knowledge. If left unchecked, compliance with ever tightening POTW pretreatment limits driven by over-protective silver water quality standards will result in billions of dollars in expenditures and affect thousands of jobs with little, if any, environmental benefit.

During the reauthorization of the Clean Water Act, the Congress has the opportunity to make changes to the Act's statutory framework to assist EPA in improving its water quality and pretreatment program for silver. The Silver Coalition recommends that Congress consider the following changes to the Clean Water Act:

1. EPA, with support from the Science Advisory Board, should expeditiously update the water quality criteria for silver to reflect its bioavailability and toxic species.
2. States need to receive EPA's assessment, including the SAB findings, and carefully consider this information during their update for silver water quality standards during the normal triennial review cycle.
3. An interim extension provision is needed in the Clean Water Act to prevent outdated water quality standards from imposing large costs on hospitals, dental offices, printers, photographic laboratories and other silver users which will result in little, or no, environmental benefit.

Further Explanation of Recommendation #1

EXPLICITLY RECOGNIZE THE SPECIATION OF SILVER -- Section 304 should be modified to allow EPA to explicitly recognize the speciation of silver in the development of its water quality criteria. The scientific underpinnings are now available for EPA to establish targeted criteria using bioavailability information rather than today's total metals methodology which considers all forms of silver to be equally toxic.

The water quality criteria for silver need to be comprehensively revised, based on input from EPA's own scientists as well as review by the SAB. Current silver water quality criteria are based on test results undertaken over 15 years ago, conducted in pure, laboratory water conditions with a silver compound, silver nitrate, that readily dissolves to free silver ions. As expected from this type of testing protocol, the observed toxicity was very high since free silver species were present. Other scientific studies simulating realistic field conditions have

shown that silver nearly instantaneously combines with other naturally-occurring substances to form much less toxic compounds, which are not bioavailable to fish and other aquatic organisms. One commonly found compound, silver sulfide, was approximately one million times less toxic than free silver ions.

To make matters worse, water quality criteria and standards are derived from testing of free silver ion while compliance monitoring tests regulate all forms of silver through total silver measurements, as if all silver species are equivalent in toxicity to free silver species. Most States have followed EPA and taken this approach. Only New York and Texas have adopted water quality standards based on the free, ionic form of silver. EPA's National Toxics Rule (required by the 1987 Clean Water Act amendments) has now implemented EPA's "guidance" silver criteria in 11 states and 2 territories. Extensive comments have been filed by the Silver Coalition and its members documenting concerns with EPA's water quality criteria for silver and aspects of the National Toxics Rule, urging recognition of the lack of bioavailability of silver compounds.

EPA's own experts support the Silver Coalition's point-of-view, as noted above. EPA is moving in the right direction, but a well-defined schedule is needed to facilitate the involvement of both the States and the regulated community in this revision of silver water quality criteria and related requirements. This schedule is important, as these revisions are very time-critical to affected health care facilities and other sectors of the photoprocessing industry, because existing regulatory processes are moving forward in many States without having this new scientific information taken into account.

The Silver Coalition legislative proposal calls for the Science Advisory Board to summarize the current science of metal speciation and bioavailability, including that for silver, within a specified time. At the conclusion of this evaluation, EPA would then be required to propose any appropriate changes in their water quality criteria within a second specified period.

Further Explanation of Recommendation #2

REQUIRE STATES TO CONSIDER ADVANCEMENTS IN WATER QUALITY SCIENCE –
Section 303 should be amended to require States to consider advancements in water quality science during their triennial water quality standards review.

Upon completion of the SAB report and EPA's water criteria modifications, State environmental agencies would then review both actions to determine appropriate changes in their water quality standards during the normal triennial review process required by Section 303 of the Clean Water Act. Following review and comment, State water quality standards for silver could then be updated to reflect the substantial advancements in water quality science.

The Silver Coalition legislative proposal, however, reserves the authority of the Administrator to issue guidance at any time that makes current water quality criteria and standards more reflective of good science, by allowing the use of a dissolved metal concentration in determining compliance with a water quality standard or establishing effluent limitations.

Further Explanation of Recommendation #3

PROVIDE INTERIM DELAY IN "BEYOND BAT" REQUIREMENTS FOR WELL-CONTROLLED SILVER SOURCES – *Section 307 should be modified to specifically allow EPA or the States to postpone water quality standard-driven permit requirements, beyond Best Available Technology Economically Achievable (BATEA), for silver for a period up to five (5) years. This allowance will enable Federal and State agencies to fully consider the state-of-the-art on silver's fate and effects in the environment. In those instances where postponement occurs, it will be conditioned on a Code of Management Practices developed and approved by the POTW and State agency to assure the maximum recovery and minimum release of silver by photoprocessors or other silver users.*

Stringent water quality limits based on total silver require POTWs to impose pretreatment standards well beyond the capability of the BATEA used in the photoprocessing industry segment. While removal of small amounts of additional silver can be accomplished by imposing such low pretreatment levels, the costs incurred bear no reasonable relationship to the resulting environmental benefits. In fact, it appears that any benefits are outweighed by new environmental concerns raised by alternative treatment. Wash water treatment facilities require the use of corrosive acids and bases in small business settings, and haul-away results in additional diesel air emissions to transport solutions to regional treatment sites. These approaches are also very expensive.

To allow the advances in water quality science to be properly incorporated into silver water quality criteria and standards, a temporary relief mechanism is needed. This will prevent the current standards and unachievable pretreatment requirements based on them from driving out small businesses, increasing the cost of health care, and adversely affecting many local economies. As part of the Clean Water Act reauthorization, the Silver Coalition is recommending that EPA and delegated States be authorized to temporarily suspend "beyond BAT" water quality based permit limits for POTWs and the related requirements for indirect dischargers, for a period up to 5 years.

The Silver Coalition recognizes, however, the importance of maximizing the recovery of silver and minimizing its release to the environment. Working with representatives of POTWs, States, and EPA, the members of the Silver Coalition will prepare a model Code of Management Practices to clearly define:

1. The Best Available Technology Economically Available methods and practices that should be used in each segment of the photoprocessing industry, from hospitals, dental offices, and photographic laboratories, all the way to 1-hour mini-labs in shopping centers.
2. Water conservation measures that should be employed to reduce wastewater discharges to POTWs.
3. Installation and use of recovery equipment to maximize the recovery of silver.

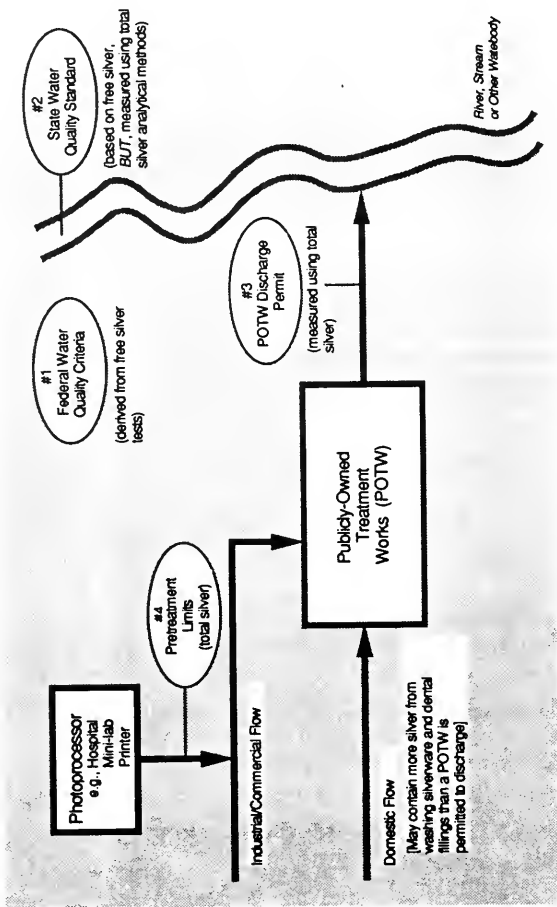

4. Operating and maintenance practices that will assure the most consistent performance of this equipment.

This generic model can then be used in individual permits as necessary where water quality standards will otherwise cause individual POTWs to impose pretreatment limits where the costs to be incurred will bear no reasonable relationship to the projected environmental benefits.

After 5 years, a complete cycle of the States' triennial water quality standards review will have occurred. Once State water quality standards are re-considered and appropriately updated, this interim provision will then lapse.

The Silver Coalition recommends that these changes be incorporated into any legislation reauthorizing the Clean Water Act. These proposals will allow adjustments to the water quality and pretreatment program for silver, reflecting our latest scientific knowledge about silver in the environment and its relative toxicity. They will allow us to avoid billions of dollars in unneeded expenditures, without any risk to the environment.

The Impact of Water Quality Criteria on Photoprocessors

Silver Coalition

**Recommended Changes to the Clean Water Act
Proposed by the Silver Coalition**

1) Statutory recognition of speciation and SAB study (amendments to section 304(a)):

Sec. . Section 304(a) of the Clean Water Act is amended by adding the following new paragraph:

"(9)(A) The Science Advisory Board shall conduct a review of the latest scientific knowledge as to the relationship between the species of metal, its bioavailability and the potential for toxicity, and the desirability of modifying water quality criteria to reflect that knowledge by using measurements of dissolved metal concentration or of toxic species of metal rather than measurements of total recoverable metal. Such review shall be completed, and the results of such review submitted to the Administrator and the Congress, as expeditiously as practicable but not later than December 31, 1994, or six months after the date of enactment of the Clean Water Act Amendments of 1994, whichever first occurs.

"(B) Not later than six months after the date of receipt of such results, the Administrator shall take such action as may be appropriate to incorporate the results of such review into water quality criteria published under this subsection. In particular, the Administrator shall modify such water quality criteria for silver, if necessary, or publish information as to the interpretation of such criteria for silver, to reflect the latest scientific knowledge as to the relationship between the species of silver and the potential for toxicity, using measurements of dissolved silver or of toxic species of silver rather than measurements of total recoverable silver."

2) Incorporate advances in knowledge on metals toxicity into triennial review process (amendments to section 303(c)(2)):

Sec. . Section 303(c)(2) of the Clean Water Act is amended by adding the following new subparagraph:

"(C) Whenever a State reviews water quality standards pursuant to paragraph (1) of this subsection, or revises or adopts new standards pursuant to this paragraph, such State shall adopt criteria for silver that reflect the latest scientific knowledge as to the relationship between the species of silver and the potential for toxicity, using measurements of dissolved silver or of toxic species of silver rather than measurements of total recoverable silver, in accordance with guidance published by the Administrator under section 304(a)(9). As part of such review, such State shall identify any substantial and widespread economic and social impact that is likely to result from a decision not to adopt, or from a decision to adopt, such revised criteria or measurements, and shall provide an opportunity for public comment on such information. Such identification and opportunity for comment shall be deemed to satisfy subsection (d)(4), and any modification of any effluent limitation resulting from the adoption of criteria under this subparagraph shall not be subject to section 402(o). Nothing in this paragraph shall be construed to limit or delay the use of any guidance of the Administrator interpreting water quality criteria to allow the use of a dissolved metals concentration measurement or similar adjustment in determining compliance with a water quality standard or establishing effluent limitations."

3) **Provide relief to indirect dischargers complying with a Code of Management Practices as well as a BATEA-based pretreatment standard, and on a temporary basis to the POTW with water quality-based effluent limitations (amendments to section 307(b)):**

Sec. . Section 307(b) of the Clean Water Act is amended by adding the following new paragraphs:

"(5) The Administrator, or the State in the case of a State with an approved permit program under section 402(b), may modify the permit conditions and effluent limitations for any publicly owned treatment works to defer for a period not to exceed five years compliance with any effluent limitation derived from a water quality standard for silver beyond that required by section 301(b)(2), notwithstanding the provisions of sections 303(d)(4) and 402(o). Any such modification and deferral shall be contingent on compliance with the applicable requirements of paragraph (6) by all affected indirect dischargers into such publicly owned treatment works, and a program of enforcement by such publicly owned treatment works and the State to assure such compliance.

"(6) Any indirect discharger that is in a class of facilities for which a code of management practices has been developed in accordance with subparagraph (B) shall not be subject to any pretreatment requirement for silver (including any local limit) based on an effluent limitation for the publicly owned treatment works derived from a water quality standard for silver, prior to the expiration of the period provided in paragraph (5), if such facility--

"(A) is in compliance with a mass limitation or concentration level for silver attainable with the application of the best available technology economically achievable for such facilities, as established by the Administrator after a review of the treatment and management practices of such class of facilities; and

"(B) is implementing a code of management practices for silver recovery, operation, and waste management appropriate for the class of facilities of which such facility is a member, developed and adopted by representatives of such industry and the publicly owned treatment works of major urban areas, in cooperation with the Administrator and the States. Such code of management practices shall reflect acceptable industry practices to minimize the amount of silver introduced into publicly owned treatment works or otherwise entering the environment from such facilities. At a minimum, such code of management practices shall address--

"(i) the use of the best available technology economically achievable, based on a review of the current state of such technology for such class of facilities, and of the effluent guidelines for such facilities;

"(ii) water conservation measures available to reduce the total quantity of discharge from such facilities to any publicly owned treatment works;

"(iii) opportunities to recover silver (and other pollutants) from the waste stream prior to introduction into any publicly owned treatment works;

"(iv) operating and maintenance practices for the process at such facilities that minimize the amount of silver introduced into publicly owned treatment works and assure consistent performance of the management practices and treatment technology specified under this paragraph."

[Note: An example of how proposed section 307(b)(6) is intended to work would be a code of management practices for silver recovery and waste management, developed and adopted by representatives of the *photoprocessing industry* and the publicly owned treatment works of major urban areas, in cooperation with the Administrator and the States. Such a code of management practices would reflect acceptable industry practices in the photoprocessing industry to minimize the amount of silver introduced into POTWs or otherwise entering the environment. Among other examples of appropriate requirements, a code of management practices for the photoprocessing industry may require—

- (i) all silver-bearing wastes, including fixers, bleach-fix solutions and superstabilizers, to be treated in a silver recovery system;
- (ii) management practices to assure acceptable loading rates from the silver recovery system and that no untreated solutions are discharged to the POTW;
- (iii) the use of a wash water limiter or control system to limit water use to the period when film is being processed, and to reduce water use to the minimum levels sufficient for adequate washing;
- (iv) adequate record-keeping as to the quantity of silver-bearing waste generated, testing of the silver recovery system, and the quantity and destination of any silver-bearing waste removed from the premises other than by introduction into the publicly owned treatment works;
- (v) installation and use of any equipment or processing chemicals which permit recycling or regeneration of spent solutions that become commercially available, and for which the costs of installation and use bear a reasonable relationship to the effluent reduction benefits.

For the purposes of this example, the term "photoprocessing facility" includes any health care facility, commercial photoprocessing or photofinishing facility, school or government photoprocessing facility, printing facility, or graphic arts facility, with respect to its processing of photographic film or paper.]

WRITTEN STATEMENT
OF THE
SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION
TO THE
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS
SUBCOMMITTEE ON CLEAN WATER, FISHERIES AND WILDLIFE
UNITED STATES SENATE
REGARDING
S. 1114 - THE WATER POLLUTION PREVENTION AND CONTROL ACT OF 1993

SEPTEMBER 30, 1993

Synthetic Organic Chemical Manufacturers Association
Written Statement on
S. 1114 -- The Water Pollution Prevention and Control Act of 1993

I. INTRODUCTION

The Synthetic Organic Chemical Manufacturers Association (SOCMA) is pleased to have the opportunity to submit this written statement to the July 1 hearing record on S. 1114, the Water Pollution Prevention and Control Act of 1993. Clean water is a goal that is strongly supported by SOCMA and its members. However, S. 1114 is of particular concern to SOCMA because it includes several provisions that SOCMA believes will impose costly burdens on its members without improving water quality or public health. SOCMA is a trade association serving more than 220 companies that have a common interest in the manufacture, distribution and marketing of organic chemical products. The majority of SOCMA's members are indirect dischargers with annual sales of under \$40 million. SOCMA's member company operations are representative of a much larger number of organic chemical manufacturers throughout the United States.

SOCMA's members are typically batch chemical manufacturers which produce organic chemicals used in thousands of products vital to consumers and U.S. industry. More than 2,000 batch processing facilities produce over 95 percent of our nation's 50,000 chemicals and polymers. This unique niche in the chemical industry is innovative, entrepreneurial and customer-driven. Batch manufacturers make smaller quantities of chemicals which have specific performance applications. Batch processing is also used for research and development projects. The chemicals and polymers produced yearly in batch processes have a value in excess of \$60 billion.

II. BACKGROUND

Much has been done in the past 25 years to improve the quality of the nation's surface waters. The greatest improvement, by far, has resulted from

the pretreatment of industrial wastewaters prior to their introduction to publicly owned treatment works (POTWs) and from reduction and control of point sources of pollution from industry and municipalities. EPA and others have reported that point source discharges account for only about 25 percent (nine percent from industry and 16 percent from municipalities) of today's pollution of surface waters. SOCMA strongly urges Congress to enact laws that recognize these accomplishments and that will bring all remaining sources of surface water, including nonpoint sources, under equally adequate control.

III. THEMES TO BE INCORPORATED IN A CWA REAUTHORIZATION BILL

SOCMA believes that a reauthorization of the Clean Water Act (CWA) without substantive changes in the law is the best course at this time. Congress should allow the current law more time to be fully implemented before mandating substantive changes to the existing program. However, since S. 1114 has been introduced in the Senate and is the subject of hearings, SOCMA would like to submit comments on this bill to the July 1 hearing record, the subject of which was "toxics".

There are certain themes that SOCMA believes should be incorporated in a CWA reauthorization bill, including: a focus on nonpoint source pollution; a watershed management approach; voluntary pollution prevention programs; national policy on mixing zones; and, permit fees for administering the National Pollutant Discharge Elimination System (NPDES) permit program. Each of these issues is explained in more detail below.

A. Focus on Nonpoint Source Pollution

SOCMA believes that a CWA reauthorization bill should focus on nonpoint sources of pollution, since they are a significant cause of the nation's water

SOCMA Statement
Page 3

quality problems. If EPA focuses attention and resources on nonpoint source pollution, significant improvements in water quality can be achieved. Instead of continuing to focus on point source control, Congress should use CWA reauthorization as a meaningful vehicle to begin to substantially reduce the nonpoint source problems.

B. Watershed Management Approach

SOCMA supports a watershed management approach to achieving water quality. As EPA has testified, it can no longer be assumed that a national approach will solve all local water quality problems. Problems differ from watershed to watershed and proper solutions will also differ from place to place. SOCMA suggests that a watershed management program be developed that incorporates site-specific concerns.

C. Pollution Prevention

SOCMA strongly supports the concept of pollution prevention, and embraces a philosophy of environmental risk reduction. There are methods for achieving pollution prevention goals, including source reduction, in-process recycling, recycling and energy recovery. SOCMA believes that an effective pollution prevention program must provide companies with flexibility to meet regulatory requirements and must recognize the large differences in product mix, individual facility size and production among chemical manufacturers.

While SOCMA supports the concept of pollution prevention, it is important to note that, given the nature of batch manufacturing operations, quantification goals are inappropriate for this type of operation. A mandated pollution prevention target may not be achievable for these operations which, due to process changes and varying consumer demands, cannot forecast the

SOCMA Statement
Page 4

feedstocks and processes which will be used to formulate their products. Thus, SOCMA believes that any legislation addressing pollution prevention should encourage development of site-specific multi-media pollution prevention programs with progress being measured on a site-specific basis.

D. A National Policy on Mixing Zones

SOCMA believes that it would be beneficial to develop a national policy that provides consistency in mixing zones between and among all states. The policy should be developed in a way that includes sound science, peer review, and widespread public comment. While SOCMA supports the development of a national policy on mixing zones, we oppose a policy that would require rigid standard approaches. Rather, SOCMA suggests that a national mixing zone policy allow for site-specific flexibility based on risk.

E. Permit Fees

SOCMA supports the concept of a permit fee and believes that fees are an appropriate source of revenue for administration of the NPDES permit program. However, levying a permit fee for purposes other than processing permit applications is inappropriate. Additionally, SOCMA believes that any permit fee should be proportional to the pounds of chemicals and other parameters discharged by the facility, such as biochemical oxygen demand (BOD).

IV. PROVISIONS OF S. 1114 THAT SOCMA OPPOSES

A. Process Changes and Product Substitution

SOCMA strongly opposes section 201 of S. 1114 which would require EPA, in the development of Best Available Technology (BAT) standards, New Source

SOCMA Statement
Page 5

Performance Standards, and Pretreatment Standards, to "rely on and require, to the maximum extent practicable, source reduction measures and practices, including changes in production, products, or raw materials". This language imposes overly intrusive and unnecessary requirements on SOCMA's members, many of which are batch processors.

Much of the U.S. chemical industry is shifting from large scale manufacturing of chemical commodities to the manufacture of specialty products specifically tailored to a particular customer or market niche. To be successful, specialty product manufacturers must be able to respond rapidly to customer demands. Sometimes only one batch of a product is ever made, or there may be a brief or seasonal production campaign to meet a multi-batch order. Because of the specialized nature of this segment of the industry, batch chemical facilities are typically small, averaging fewer than 100 employees. It would be disastrous for the batch processing industry, which produces over 95 percent of our nation's 50,000 chemicals, to be subject to an EPA mandate that requires process changes and raw material changes. Section 201 is inflexible and inappropriate and would pose a serious threat to the competitiveness of the batch processing industry.

B. Domestic Sewage Exclusion

SOCMA opposes the provision in S. 1114 that eliminates the domestic sewage exclusion (DSE). Because this provision requires discharges of chemicals that are not subject to an effluent guideline to meet Resource Conservation and Recovery Act (RCRA) Best Demonstrated Available Technology (BDAT) standards, many of SOCMA's members will be subject to standards that their existing pretreatment facilities may not be able to meet. One reason that these indirect dischargers may not be able to meet the RCRA BDAT standards is because existing pretreatment facilities are designed to meet

SOCMA Statement
Page 6

Clean Water Act Best Available Technology (BAT) limits, not RCRA BDAT standards. Additionally, BAT limits take into account matrix interferences that may occur as a result of the combined waste stream which are prevalent in the batch processing industry. BDAT wastewater standards are based, in contrast, on the treatability of individual hazardous waste streams, not the combined waste stream.

Elimination of the DSE would be particularly disruptive to batch processors which use biodegradable solvents such as acetone and methanol to synthesize many complex and beneficial products. Despite the employment of numerous pollution prevention techniques, it is virtually impossible to guarantee that small releases of spent acetone and methanol solvents will not enter a municipal sewer system. Small releases of water soluble solvents can occur during water washing and other product purification steps.

The Clean Water Act provides the appropriate forum for the regulation of hazardous waste in wastewater. SOCMA believes that most POTWs can properly treat most of the waste streams which they now receive. The existing mechanism for establishment of local limits will deal effectively with those waste streams that a particular POTW can not handle properly.

C. Ban on Toxic Chemicals

SOCMA opposes the provision in S. 1114 that requires EPA to list "highly toxic or toxic and highly bioaccumulative pollutants" and then to ban the discharge of these pollutants. Because a "toxic" chemical is present, it does not mean that the chemical is toxic to human health and the environment. The presence of a chemical does not determine its toxicity. Rather, it is the amount of the chemical that determines toxicity. Any restriction on the presence of chemicals should be based on risk assessment and other sound

SOCMA Statement

Page 7

scientific approaches, rather than on an arbitrary listing of a specific number of chemicals.

D. Removal Credits

SOCMA opposes the provision in S. 1114 that would restrict the availability of removal credits. SOCMA believes that removal credits allow for cost effective, non-redundant capital and operating expenses. S. 1114 removes the existing provision for removal credits and, in section 204 (b), adds replacement language. The replacement language retains the language requiring that the removal credit "...not prevent sludge use or disposal ...in accordance with section 405,". This language would eliminate removal credits for compounds not provided with sludge limits or a determination that limits are not needed. It also adds a new restriction by requiring "the treatment ...results in the biodegradation of the toxic pollutant, as determined by the Administrator." The current CWA and regulations allow POTW removal by physical, chemical or biological means. The proposed provision would prevent removal credits for all the metals and perhaps some of the organics. It would also delay the issuance of removal credits until the Administrator makes a determination.

E. Fees for Effluent Guidelines

SOCMA opposes the section of S. 1114 that would require fees for the development of effluent guidelines for two reasons. First, SOCMA opposes the section because it does not set forth a mechanism to control the use of the money collected. Second, we believe that this section does not allow for representation of facilities that are regulated under these guidelines. There is no incentive for EPA to act in a cost effective manner. SOCMA believes that industry should not be responsible for funding the development

SOCMA Statement
Page 8

of effluent guidelines. However, if a fee is to be imposed, SOCMA believes it should be proportional to the pounds of chemicals and other parameters discharged. We strongly believe that the development of effluent guidelines should be financed through general funding.

F. National Pollutant Discharge Elimination System (NPDES) Permits for Pretreaters

SOCMA believes that reauthorization of the CWA should not expand the scope of the National Pretreatment Program to include indirect dischargers in the NPDES program. The regulation of indirect dischargers currently resides with the states and POTWs. SOCMA believes that it is appropriate for the regulation of indirect dischargers to remain the responsibility of the states and POTWs. Further, the pretreatment section of S. 1114 fails to recognize that indirect dischargers are already subject to EPA's pretreatment regulations.

V. CONCLUSION

In conclusion, SOCMA believes that in reauthorizing the CWA, Congress should focus on the following concepts: focus on nonpoint source pollution; a watershed management approach; national policy on mixing zones; and permit fees limited to administering the NPDES permit program. If S. 1114 is to be the CWA reauthorization vehicle, Congress should revise the sections dealing with product substitution, DSE, the ban on toxics and removal credits.

FAX: (412) 624-1108

The Honorable Bob Graham, Chairman
Clean Water, Fisheries and Wildlife Subcommittee
Senate Committee on Environment and Public Works
SH-456 Dirksen Senate Office Building
Washington, DC 20510

Dear Senator Graham:

PRESIDENT-ELECT

Philip E. Gerwert
Ass't Dir., Plant Environment Dept.
General Motors Research and
Environmental Staff
30500 Mound Road, Box 9055
Warren, MI 48090-9055
(313) 947-1875
FAX: (313) 947-1422

The Water Environment Federation submits the following comments on S. 1114, the Water Pollution Prevention and Control Act of 1993, and requests their inclusion as part of the record of the recent Clean Water Act reauthorization hearings held by the Clean Water, Fisheries, and Wildlife Subcommittee. These comments summarize WEF's views on a number of provisions contained in S. 1114. More detailed comments on specific provisions will be submitted in the near future.

VICE PRESIDENT

Michael R. Pollen
President
Northern Testing Laboratories, Inc.
3330 Industrial Avenue
Fairbanks, AK 99701
(907) 456-3116
FAX: (907) 456-3125

The Water Environment Federation (WEF) is a not-for-profit technical, educational and professional organization devoted to providing leadership and guidance in the preservation and enhancement of the global water environment. Founded in 1928, our more than 40,000 members include engineers, scientists, wastewater treatment plant operators and managers, and others working in state and local government, federal agencies, academia, industry, and private practice. In short, our members are the professionals involved directly in restoring and protecting the nation's water quality.

TREASURER

Robert F. Roskopf
President
Rieke Corroll Muller Associates, Inc.
10901 Red Circle Drive, Suite 200
Minnetonka, MN 55343
(612) 935-6901
FAX: (612) 935-8814

WEF supports reauthorization of the Clean Water Act and the overall direction of S. 1114. We believe it will help ensure continued progress under the Clean Water Act in maintaining and enhancing water quality. A number of concerns and suggested improvements which we raised to Senator Baucus in comments submitted on S. 1081 in the 102nd Congress have been addressed in this bill. We appreciate greatly the attention that was paid to WEF's previous comments, as well as your willingness to receive our input on S. 1114.

PAST PRESIDENT

Roger J. Dorian
General Manager, Chief Engineer
Central Contra Costa Sanitary District
5019 Inhoff Plaza
Martinez, CA 94553-4392
(510) 689-3890
FAX: (510) 676-7211

Our comments are divided into three sections: provisions supported by the Federation; provisions with which we are concerned, and; additional issues which WEF believes should be addressed in the forthcoming legislation.

Letter to Sen. Bob Graham
August 4, 1993
Page 2

**1. PROVISIONS IN S. 1114 SUPPORTED BY THE WATER ENVIRONMENT
FEDERATION**

Funding

* WEF supports the baseline \$2.5 billion reauthorization of State Revolving Fund (SRF) capitalization grants through FY 2000. Funding far above this level will be needed, however, to meet currently identified, as well as previously unforeseen, needs. [SECTION 101]

* WEF supports allowance for more types of projects to be eligible for SRF assistance. States should have the flexibility to address problems which are of greatest water quality significance. [SECTION 101]

* WEF supports allowing states to use matching grants to assist small communities. Small communities face unique financial, technical and compliance problems which need special attention. [SECTION 101]

* WEF supports continued funding for Section 106 state management grants. This funding is an important part of enabling states to manage the national water quality program. [SECTION 102]

* WEF supports an appropriate level of funding for federal water quality programs. EPA in general, and the Office of Water in particular, is being squeezed by ever-increasing responsibilities and mandates while their financial resources are being reduced. [SECTION 103]

Watershed Management/Nonpoint Source Pollution

* WEF supports using a watershed management approach to water quality. Many water quality professionals believe this is the best approach to water quality management because it takes into account multiple sources of pollutants, environmental benefits, attainability, cross-media impacts, and naturally-occurring conditions. [SECTION 302]

* WEF believes nonpoint sources of pollution should be controlled through pollution prevention and use of Best Management Practices. These sources, by their nature, are diffuse and have site-specific, highly variable impacts on water quality which can better be addressed through practices which recognize these factors. [SECTION 303]

Letter to Sen. Bob Graham
August 4, 1993
Page 3

Combined Sewer Overflows

* WEF is in general agreement with the current draft EPA policy, but remains concerned about the lack of prioritization, flexibility, phased compliance, and other issues. [SECTION 401]

Stormwater

* WEF believes management measures should be the initial basis of regulation. Water quality limits should be used only if discharges are having a quantifiable adverse impact on receiving waters. A better understanding of wet weather impacts is needed in order to regulate stormwater discharges properly. [SECTION 402]

Water Conservation

* WEF supports, in general, provisions encouraging water conservation. Provisions which encourage water reuse specifically should be added. [SECTION 403]

Permit Fees

* WEF supports requiring states to collect fees to offset costs of water quality programs. WEF supports the principle of having dischargers and users pay the cost of water quality protection. [SECTION 501]

Technology Demonstration

* WEF supports encouragement of innovative and alternative technology. These technologies hold the promise of greater water quality protection and clean-up at lower costs. [SECTION 601]

Education

* WEF supports a national water quality education program. Ultimate responsibility for ensuring the protection of water resources begins at the individual level. [SECTION 606]

Letter to Sen. Bob Graham
 August 4, 1993
 Page 4

2. PROVISIONS IN S. 1114 OF CONCERN TO THE WATER ENVIRONMENT FEDERATION

Water Quality Criteria

* WEF believes federally set criteria should not automatically become enforceable standards. States need flexibility to implement numeric limits which recognize local and regional variables. [SECTION 202]

Sediment Quality Criteria

* WEF believes the current state of scientific knowledge and understanding is insufficient to set sediment quality standards with confidence. More resources are needed for data collection and research. [SECTION 202]

Pollution Prevention

* WEF believes the focus should be on stimulating and encouraging pollution prevention through economic and regulatory incentives using a voluntary approach. WEF supports requiring site-specific pollution prevention planning, but does not believe that specific methodologies or uniform reduction levels, such as those outlined in S. 1114, should be mandated. [SECTION 205]

Monitoring

* WEF believes the proposed Water Quality Monitoring Council should include representatives from the professional environmental science/engineering community. Many of those directly responsible for monitoring water quality are engineers and other environmental professionals who work for, and with, municipal agencies and the private sector. [SECTION 301]

3. ADDITIONAL ISSUES WHICH THE WATER ENVIRONMENT FEDERATION BELIEVES NEED TO BE ADDRESSED:

CWA Goals

* WEF believes environmental priority setting and management, consideration of cross-media impacts, pollution prevention, and beneficial use of sludge (biosolids) should be added explicitly to the goals of the Act.

Letter to Sen. Bob Graham
August 4, 1993
Page 5

Water Quality Research

* WEF believes specific authorization for basic (non-regulatory) water quality research is needed. Research is critical to better understanding water quality problems and developing improved clean-up and protection technologies and policies.

Peer Review

* WEF believes all new and revised water quality criteria, effluent guidelines, and pretreatment guidelines should be subject to peer review. Peer review is needed to ensure the technical and scientific soundness, as well as the credibility, of proposed criteria and guidelines.

Privatization

* WEF believes statutory and regulatory impediments under the Clean Water Act which discourage private sector investment in wastewater facilities should be addressed in reauthorization. All available sources of financing must be accessed in order to meet water quality needs and goals.

Small Communities

* In addition to giving states authority to provide targeted technical and financial assistance to small communities, WEF believes states should be given authority to allow alternative technologies to be used when doing so would provide an equivalent level of protection.

Sludge (Biosolids)

* Sludge (otherwise known as biosolids when it can be beneficially utilized) should be regulated solely under the CWA, and not as a hazardous waste under RCRA. Biosolids is a by-product of the wastewater treatment process, and overlapping or conflicting regulation should be avoided in order to promote beneficial uses.

The Water Environment Federation appreciates this opportunity to provide input into the Clean Water Act reauthorization process. We are preparing additional comments on provisions of this legislation which are still under review by our membership. We support continuance of a

Letter to Sen. Bob Graham
August 4, 1993
Page 6

strong and viable national water quality program, and would be happy to provide you with any additional comments or technical assistance on proposed amendments to the Act. Any questions should be directed to John Thorner, Director of Public Affairs, at (703) 684-2416.

We look forward to working with you to continue improving our nation's water quality.

Sincerely,

A handwritten signature in black ink, appearing to read "Charles A. Sorber". The signature is stylized with a large, looped initial "C" and a long, sweeping horizontal stroke at the end.

Charles A. Sorber
President

**REQUEST FOR AUTHORIZATION FOR FUNDING
FOR
WATER ENVIRONMENT RESEARCH FOUNDATION**

**PRESENTED
TO
SENATE SUBCOMMITTEE ON
CLEAN WATER, FISHERIES, AND WILDLIFE**

BY

**GEORGE D. BARNES, P.E., DIRECTOR
BUREAU OF POLLUTION CONTROL
DEPARTMENT OF PUBLIC WORKS
CITY OF ATLANTA, GEORGIA
AND
CHAIRMAN, BOARD OF DIRECTORS
WATER ENVIRONMENT RESEARCH FOUNDATION**

AUGUST 4, 1993

Chairman Graham and members of the Clean Water, Fisheries, and Wildlife Subcommittee. My name is George D. Barnes and I am Director of the Bureau of Pollution Control for the City of Atlanta. I am here today on behalf of the Water Environment Research Foundation in my role as Chairman of the Board of Directors to ask for your support of our request for authorization at the level of \$5 million.

The Research Foundation is an organization that is very important to my city and to its other Subscribers. The Foundation was organized in 1989 and has grown steadily to its current level of membership of more than 160 Subscribers. These Subscribers represent more than 70 million people and include municipal wastewater utilities, industry, consultants and equipment manufacturers. Over the past three years our Subscribers have invested approximately \$3 million in the Foundation. During this same period, an added investment of \$2.7 million has been made by the federal government.

These dollars have been committed to fund more than 33 specific research projects that have been identified and prioritized by the Foundation's Subscribers, in the areas of Human Health and Environmental Effects, Integrated Resource Management, Collection and Treatment Systems, and Residuals Management. These projects will provide important information that will directly benefit environmental protection and the communities that we serve. By combining the municipal/federal investment with dollar-for-dollar matches from other sources, the Foundation has leveraged its investments to fund more than \$11 million worth of active research.

I would like to provide the committee with a brief overview of the organization and operating policies of the Research Foundation to illustrate how research projects are identified and managed and how our funds are used.

The Research Foundation is a not for profit corporation that is governed by a Board of Directors representing the general makeup of its Subscribers. In addition, the Board has established a Research Council, composed of nationally recognized experts from the municipal, academic, consultant, industrial and regulatory areas, to develop and oversee the Foundation's Research Program. The Board of Directors and the Research Council are composed of volunteers who serve with no compensation from the Foundation. The day to day activities of the Foundation are carried out by a full time staff of 8 professionals. Approximately 84% percent of our annual revenues are expended for research and approximately 16% percent for administration.

A Five-Year Research and Development Plan is developed annually, with full input from the Research Council and Subscribers, to cover specific areas of concern that have been identified and prioritized. A list of the current research projects and areas proposed for 1994 research is attached.

I will focus my remaining remarks by giving you some general background on several of the key projects that are underway in the areas that were previously mentioned.

RESIDUALS MANAGEMENT

The Foundation is concerned with both facilities which incinerate, and those which use a form of land disposal. Information derived from current and future studies will allow utilities more freedom in selecting the most suitable technologies for biosolids treatment and disposal, and will provide tools to promote public acceptance.

Our project on the Evaluation and Quantification of Biosolids Incinerator Hydrocarbon Emissions is looking at the extent to which incinerators represent a health risk. Recent health risk assessments are based upon total hydrocarbon measurements. This THC measurement is used for all organic compounds that might be emitted from a biosolids incinerator. However, cancer potency and risk factors vary, and are most often established on a compound by compound basis. Regulatory agencies have been forced to lump these compounds together forming a composite unit risk factor, while there is little data to verify the assumptions that underlie this grouping and the subsequent health risk assessments for biosolids incinerators.

The first phase of this project has been completed and the information that was obtained was extremely useful to EPA and the municipalities that utilize incineration, for the establishment of scientifically sound and acceptable criteria for the disposal of biosolids. The data provided by the Research Foundation will result in savings to municipalities of millions of dollars in fuel costs and will provide for an acceptable level of protection for human health and the environment.

In the area of land application we are conducting research that will Document Long-Term Experience of Biosolids Application Programs. This project will undertake the documentation of experiences at land application sites that have operated for more than ten years to provide the public and responsible officials with credible information on which to base policy decisions. This report will be available this year.

We are expanding our land application research through a cooperative project with the New York State Energy Resources Development Agency. This \$250,000 cooperative project will gather new data on the effects of thermal processing and natural elements on long term application of biosolids.

Again in the area of biosolids, the Foundation is participating in a project sponsored by the National Research Council which will study the Use of Treated Municipal Wastewater Effluent and Biosolids in the Production of Crops for Human Consumption.

Future biosolids research is addressing the Demonstration of Soil Remediation with Sewage Biosolids to Reduce Bioavailability of Metals. This will be of interest to municipalities and EPA in that it focuses on a beneficial use of wastewater biosolids and information on the relative bioavailability to mediate soil-born metals. The results of this study could help to clarify the issue of whether a new and inexpensive resource is readily available for remediating urban soils contaminated with lead from auto exhausts and other sources.

INTEGRATED RESOURCES MANAGEMENT

Integrated Resource Management is gaining popularity and looms on the horizon as a challenge to water quality professionals. Changes in current regulations are requiring utilities to look at the future responsibility for the entire watershed. The Foundation's Nonpoint Source research and Aquatic Ecological Risk research begins to put the watershed management puzzle together while providing information that will be of immediate use.

Federal NPS initiatives are forcing state governments to implement regulations before the resulting needs can be fully identified and researched. Many of the current point source regulations are based on dry weather standards. Because the loading of NPS primarily occurs during wet weather there is cause to question whether current standards should apply.

While there is no question that we are in support of reducing the environmental impact from nonpoint source pollution, there is a question as to the required level of treatment. By understanding the impact of NPS, it is possible that wet weather standards could be developed to fully protect the environment and at the same time reduce the costs associated with overly conservative controls.

One of the research projects underway looks at the Identification and Evaluation of Use-Attainability Methodologies for Aquatic Ecosystems. This research will provide a comprehensive and valid technical resource to conduct use-attainability analysis to accurately establish present uses and prediction of potential uses to develop the most appropriate management techniques to optimize the net environmental benefit. Also included will be a detailed discussion and support analysis of recommended methodologies and their applications.

We have also funded a project which Identifies Effective Sampling Protocols for Nonpoint Source Pollutants. The main premise for this research is that most monitoring systems are limited to a relatively small number of samples collected during storm events and lack continuous stream discharge measurements. This, in turn, produces inaccurate NPS load estimates and limits the development, calibration and testing of storm-loaded predicting models.

As one of the goals of the Research Foundation is to eliminate duplication of effort, this study will expand on data sets already under study and includes on-going sampling services provided by the U.S. Geological Survey. This research will determine the amount of suspended sediments, nutrients and pesticides transported by surface and subsurface waters draining from agricultural basins. The result will be the organization of sampling strategies for assessing the impact of nonpoint source pollutants in receiving streams and efficacy of agricultural best management practices. A final report will be prepared representing a systematic evaluation of storm event sampling requirements to estimate pollutant loading.

Other projects will provide research dollars for studies in the Use of Riparian Buffer Zones and Constructed Wetlands in Water Quality Management Programs and also research on Particulate and Particulate-Pollutants Interaction in Water Bodies and Wetlands Receiving Point and Nonpoint Discharges.

HUMAN HEALTH AND ENVIRONMENTAL EFFECTS

Closely related to the study of NPS is that of Aquatic Ecological Risk. In this instance we look at the magnitude and probability of human activities and natural phenomena on the watershed's ecosystem.

Because all hazardous materials cannot be tested in-depth, risk assessment protocols should be able to screen substances for environmental risks using minimal testing and evaluation efforts. Such protocols should be capable of delineating high risk situations that require immediate action, from those that have a potential but ambiguous risk, and those which have negligible risk.

We are currently funding a project which will Develop, Test, Validate and Refine Protocols for Assessing Aquatic Ecological Risk. While a large number of risk assessment protocols have been proposed or applied, none of these are currently comprehensive and flexible enough to be directly applicable to water quality criteria, standards and NPDES permit limitations. As more risk-based regulations are imposed it becomes increasingly important for research of this type which will produce a comprehensive methodology for using Aquatic Ecological Risk assessments to derive both numerical and narrative quality criteria and standards.

The Research Foundation has started another project in this area which will study the Time-Scale Effects of Chemically Toxic Events in Freshwater and/or Marine Ecosystems. This study will address the need to assess the time-scale impacts associated with point and NPS toxicity for pollutant loadings in different aquatic ecosystems. Understanding this issue is important in developing toxics discharge regulations for Combined Sewer Overflows (CSOs) and other stormwater events.

As an extension to this research, the last area I want to mention is the Foundation's involvement in the Great Lakes Initiatives. The Water Environment Federation's work group in this area has approached the Research Foundation to consider playing a role in the need for scientifically sound water quality criteria. The Foundation is in the process of developing an independent research plan to improve the database and science used to establish water quality criteria. The Foundation would then solicit and accept donations from municipalities, consultants, and industry, to contract for independent research.

As you have heard, the Water Environment Research Foundation is addressing the needs and concerns of the cities and utility agencies that are faced with making major financial commitments that have a direct impact on the citizens they serve.

The municipal subscribers to the Foundation are supporting the Foundation through annual subscription rates that are based on \$250 per million gallons of daily average treated flow. The minimum rate is \$250 for the smallest facilities and it caps at \$75,000 for the largest facilities. To give you an idea, Atlanta is a 148 million gallon facility and our yearly subscription rate is \$37,000. Our elected officials have supported this investment because they realize that a return of many times this amount is obtained from the research work that is being done. For example, the amount of money Atlanta is saving on the incinerator hydrocarbon emissions study alone will pay our subscription rate for the next 10 years.

In addition to the financial contribution that is made annually by our Subscribers, many utilities are contributing direct support through the participation of staff members on the Board of Directors and the Research council. This includes Subscribers such as Erwin Odeal from the Northeast Ohio Regional Sewer District, Edward Wagner from the City of New York, Department of Environmental Protection, Terry Rolan from the City of Durham and Joe Stowe from Charlotte-Mecklenburg Utility in North Carolina, Gordon Voss from Metropolitan Waste Control Commission Minnesota, Kumar Kishinchan from the City of Philadelphia Pennsylvania, and John Lampe from the East Bay Municipal Utility District in Oakland, California.

Federal Funding previously received by the Research Foundation includes \$1.5 million in FY'91, \$.5 million in FY '92 and \$.7 million in FY '93, bringing the total to \$2.7 million of Federal Funding. The EPA is actively participating with the Foundation in the identification of research projects and in the selection of projects for which the federal funds will be allocated.

Through it's collaborative funding efforts, the Research Foundation has made an admirable start in addressing some of the nation's most pressing water quality research needs, however, there is much more that still needs to be done.

When utility directors such as myself go in front of our elected officials and rate payers to request support and funding for state and federally mandated environmental programs, we must have confidence that the mandates are based on sound and documented scientific information. In our view, it is essential that the federal partnership with the Research Foundation be continued so that we and the citizens that we all serve will be able to confidently support the programs that are required to protect and enhance the environment.

I again urge for you to support of our request for funding authority at the level of \$5 million.

I sincerely appreciate the opportunity to appear before you today and I would be pleased to answer any questions.

WATER ENVIRONMENT RESEARCH FOUNDATION

CURRENTLY FUNDED RESEARCH

Biodegradation of Organic Pollutants in Anaerobic Digestion

Comparative Efficiency of Chlorination-Dechlorination and UV Irradiation

Evaluation of Biodegradation Rates of Toxic Organic Chemicals

Assessment of Research Needs for Nutrient Removal from Wastewater

On-Line Monitoring to Control Transients in Wastewater Treatment

Low Emissions Sewer Systems for Industry

Optimization of Vortex Separator Removal Efficiencies

Identification and Evaluation of Use-Attainability Methodologies for Aquatic Ecosystems

Stripping and Volatilization in Wastewater Facilities

Sampling and Analytical Methods for Air Emissions Measurements

Control and Production of Toxic Air Emissions by POTW Odor Control Equipment

Vapor-Phase Biological Control of POTW Air Emissions

Use of Riparian Buffer Zones and Constructed Wetlands in Water Quality Management Programs

Transport and Fate of Pollutants in Sediments

Water Reuse Assessment

Document Long Term Experience of Sludge Land Application Programs

Evaluate and Quantify Sludge Incinerator Hydrocarbon Emissions

Polymer Characterization & Control in Sludge Management

Demonstration of the Soil Remediation with Sewage Sludge to Reduce Bioavailability of Metals

Long Term Fate of Land Applied Wastewater Materials

The Use of Treated Municipal Wastewater Effluents and Sludge in Production of Crops for Human Consumption

Survival and Regrowth of Disinfected Indicator Bacteria

Develop, Test, Validate and Refine Protocols for Assessing Aquatic Ecological Risks

Time-Scale Effects of Chemically Toxic Events in Freshwater and/or Marine Ecosystems

Collaborative National Study Using Molecular Techniques to Detect Hepatitis A Virus and Virulence factor

Genes in *E. coli*

WATER ENVIRONMENT RESEARCH FOUNDATION**PROPOSED RESEARCH FOR 1994**

Prediction of the Equilibrium and Rate Expressions that Describe the Dissolved and Particulate States of Metals in Wastewater

Secondary Clarification Assessment

Understanding the Impacts of NPS Snowmelt on Urban Receiving Waters

Particulates and Particulate-Pollutant Interactions in Water Bodies and Wetlands Receiving Point and Nonpoint Discharges

Small Wastewater Systems Research

Watershed Management Protocol

Establishing Sludge Stability Criteria

Influence of Polymer Chemistry on Sludge Products and the Environment

Bioassays and Measures of Toxicity Workshop

Risk Management Workshop

Water Quality Indicators Workshop

Improved Enumeration Techniques for Indicator Bacteria and Pathogens

Effects of Residual Disinfectants and By-Products in Aquatic Ecosystems
